If you have questions about installing or using this software, check this and other documents first - you will find answers to most of your questions on the [Technical Papers](#) webpage or in [StarWind Forum](#). If you need further assistance, please [contact us](#) .

About StarWind

StarWind is a pioneer in virtualization and a company that participated in the development of this technology from its earliest days. Now the company is among the leading vendors of software and hardware hyper-converged solutions. The company's core product is the years-proven StarWind Virtual SAN, which allows SMB and ROBO to benefit from cost-efficient hyperconverged IT infrastructure. Having earned a reputation of reliability, StarWind created a hardware product line and is actively tapping into hyperconverged and storage appliances market. In 2016, Gartner named StarWind “Cool Vendor for Compute Platforms” following the success and popularity of StarWind HyperConverged Appliance. StarWind partners with world-known companies: Microsoft, VMware, Veeam, Intel, Dell, Mellanox, Citrix, Western Digital, etc.

Annotation

Relevant Products

This guide is applicable to StarWind Virtual SAN and StarWind Virtual SAN Free (Version V8 (Build 15260, CVM Version 20231016) and later).

For older versions of StarWind Virtual SAN (Version V8 (Build 15260, OVF Version 20230901) and earlier), please refer to this configuration guide: [StarWind Virtual SAN: Configuration Guide for Microsoft Windows Server \[Hyper-V\], VSAN Deployed as a Controller VM \(CVM\) using PowerShell CLI](#)

Purpose

The guide is to assist IT professionals and system administrators in the seamless deployment and configuration of Failover Cluster on Microsoft Windows Server with storage, provided by StarWind Virtual SAN CVM, while emphasizing adherence to best practices and system requirements.

Audience

This guide is designed for IT specialists, system administrators, and technical professionals aiming to deploy and configure Failover Cluster on Microsoft Windows Server with StarWind Virtual SAN CVM shared storage created with PowerShell CLI.

Expected Result

Upon completion of this guide, users will have gained a comprehensive understanding of the deployment and configuration process for Failover cluster on Microsoft Windows Server with StarWind CVM-based highly-available storage.

Introduction To Starwind Virtual San Cvm

StarWind Virtual SAN Controller Virtual Machine (CVM) comes as a prepackaged Linux Virtual Machine (VM) to be deployed on any industry-standard hypervisor. It creates a VM-centric and high-performing storage pool for a VM cluster.

This guide describes the deployment and configuration process of the StarWind Virtual SAN CVM.

Starwind Vsan System Requirements

Prior to installing StarWind Virtual SAN, please make sure that the system meets the requirements, which are available via the following link:

<https://www.starwindsoftware.com/system-requirements>

Recommended RAID settings for HDD and SSD disks:

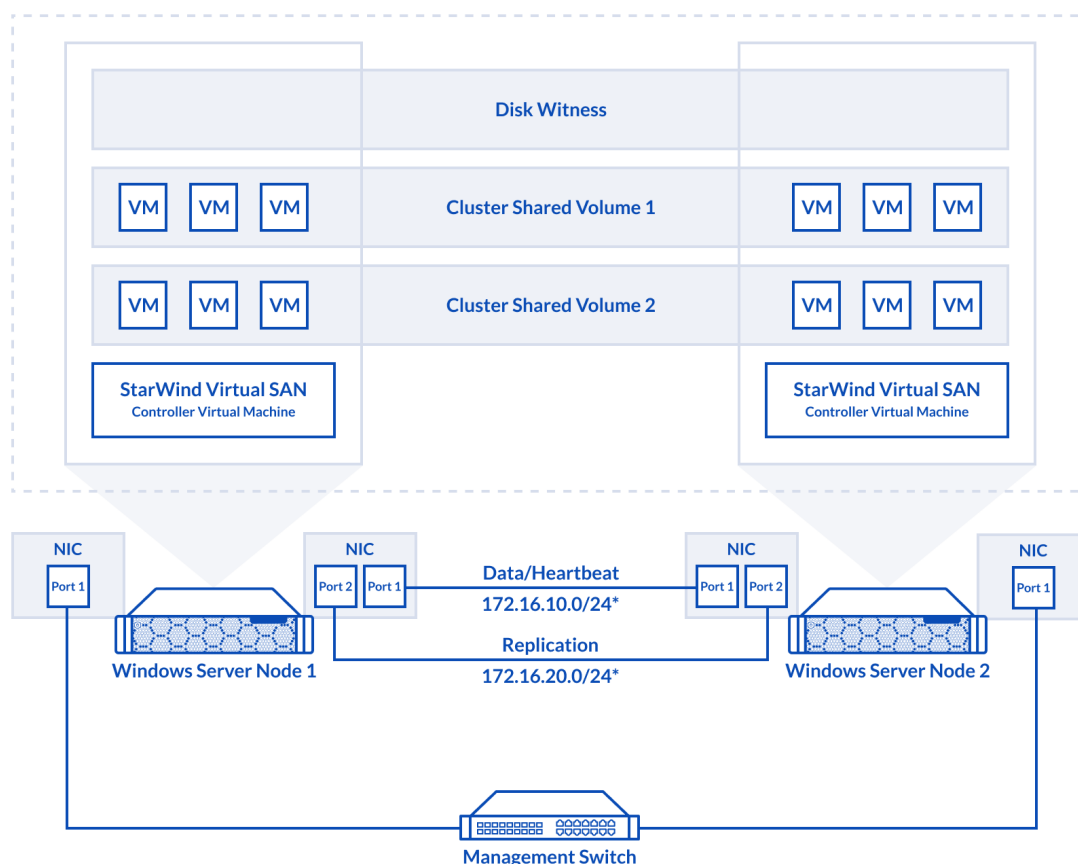

<https://knowledgebase.starwindsoftware.com/guidance/recommended-raid-settings-for-hdd-and-ssd-disks/>

Please read StarWind Virtual SAN Best Practices document for additional information:

<https://www.starwindsoftware.com/resource-library/starwind-virtual-san-best-practices>

Pre-Configuring The Windows Server Hosts

The diagram below illustrates the network and storage configuration of the solution:

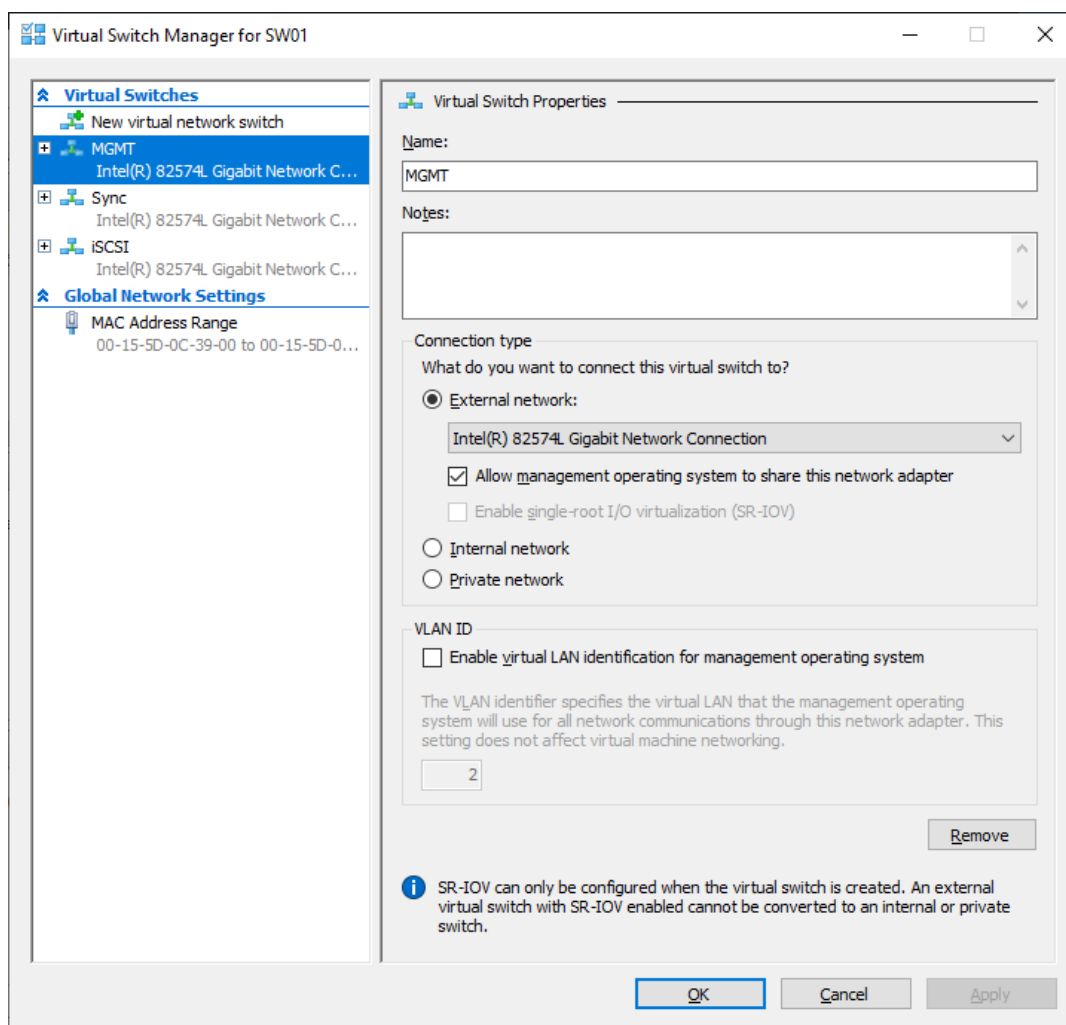

1. Make sure that a domain controller is configured and the servers are added to the domain.

NOTE: Please follow the recommendation in [KB article](#) on how to place a DC in case of StarWind Virtual SAN usage.

2. Deploy Windows Server on each server and install Failover Clustering and Multipath I/O features, as well as the Hyper-V role on both servers. This can be done through Server Manager (Add Roles and Features menu item).

3. Define at least 2x network interfaces on each node that will be used for the Synchronization and iSCSI/StarWind heartbeat traffic. Do not use iSCSI/Heartbeat and Synchronization channels over the same physical link. Synchronization and iSCSI/Heartbeat links can be connected either via redundant switches or directly between the nodes (see diagram above).

4. Separate external Virtual Switches should be created for iSCSI and Synchronization traffic based on the selected before iSCSI and Synchronization interfaces. Using Hyper-V Manager open Virtual Switch Manager and create two external Virtual Switches: one for the iSCSI/StarWind Heartbeat channel (iSCSI) and another one for the Synchronization channel (Sync).

5. Configure and set the IP address on each virtual switch interface. In this document, the 172.16.10.x subnet is used for iSCSI/StarWind heartbeat traffic, while 172.16.20.x subnet is used for the Synchronization traffic.

NOTE: In case NIC supports SR-IOV, enable it for the best performance. An additional internal switch is required for iSCSI Connection. Contact support for additional details.

6. Set MTU size to 9000 on iSCSI and Sync interfaces using the following Powershell script.

```
$iSCSIs = (Get-NetAdapter -Name "*iSCSI*").Name
$Syncs = (Get-NetAdapter -Name "*Sync*").Name
foreach ($iSCSI in $iSCSIs) {
Set-NetAdapterAdvancedProperty -Name "$iSCSI" -RegistryKeyword
"*JumboPacket" -Registryvalue 9014
Get-NetAdapterAdvancedProperty -Name "$iSCSI" -RegistryKeyword
"*JumboPacket"
}
}
```

```
foreach ($Sync in $Syncs) {  
Set-NetAdapterAdvancedProperty -Name "$Sync" -RegistryKeyword  
"*JumboPacket" -Registryvalue 9014  
Get-NetAdapterAdvancedProperty -Name "$Sync" -RegistryKeyword  
"*JumboPacket"  
}
```

It will apply MTU 9000 to all iSCSI and Sync interfaces if they have iSCSI or Sync as part of their name.

NOTE: MTU setting should be applied on the adapters only if there is no live production running through the NICs.

Enabling Multipath Support

7. Open the MPIO Properties manager: Start -> Windows Administrative Tools -> MPIO. Alternatively, run the following PowerShell command :

```
mpiocpl
```

8. In the Discover Multi-Paths tab, select the Add support for iSCSI devices checkbox and click Add.

9. When prompted to restart the server, click Yes to proceed.

10. Repeat the same procedure on the other server.

Installing File Server Roles

Please follow the steps below if file shares configuration is required

Scale-Out File Server (Sofs) For Application Data

1. Open Server Manager: Start -> Server Manager.
2. Select: Manage -> Add Roles and Features.
3. Follow the installation wizard steps to install the roles selected in the screenshot

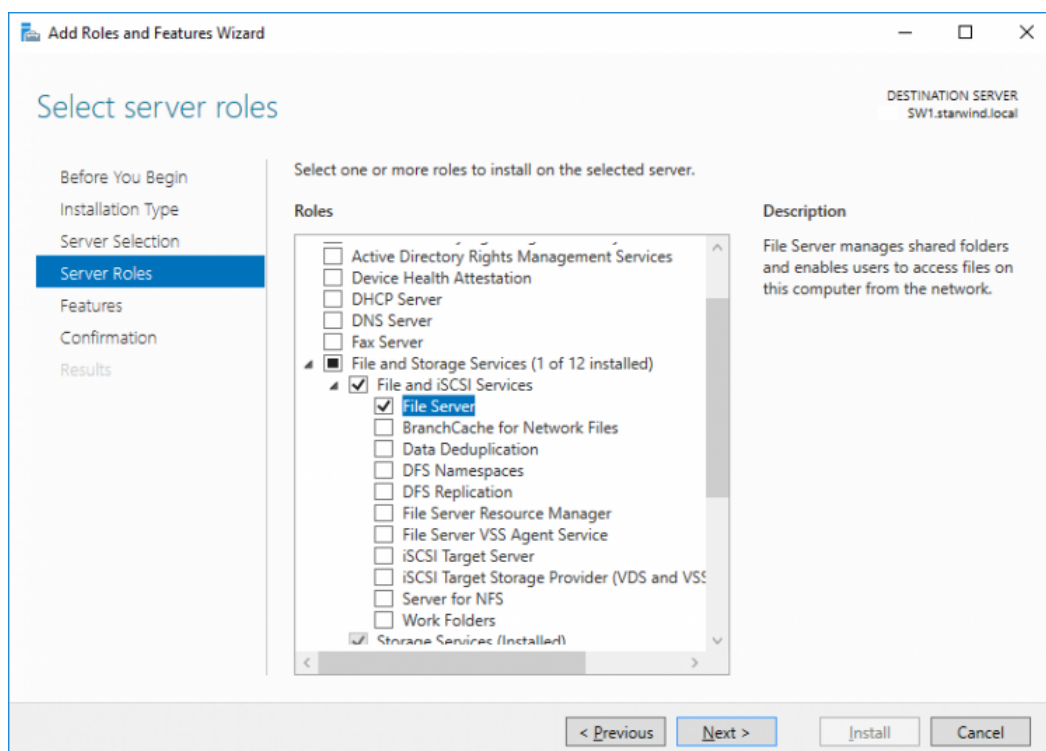

below:

4. Restart the server after installation is completed and perform steps above on the each server.

File Server For General Use With Smb Share

1. Open Server Manager: Start -> Server Manager.
2. Select: Manage -> Add Roles and Features.
3. Follow the installation wizard steps to install the roles selected in the screenshot below:

4. Restart the server after installation is completed and perform steps above on each server.

File Server For General Use With Nfs Share

1. Open Server Manager: Start -> Server Manager.
2. Select: Manage -> Add Roles and Features.
3. Follow the installation wizard steps to install the roles selected in the screenshot below:

4. Restart the server after installation is completed and perform steps above on each server.

Deploying Starwind Virtual San Cvm

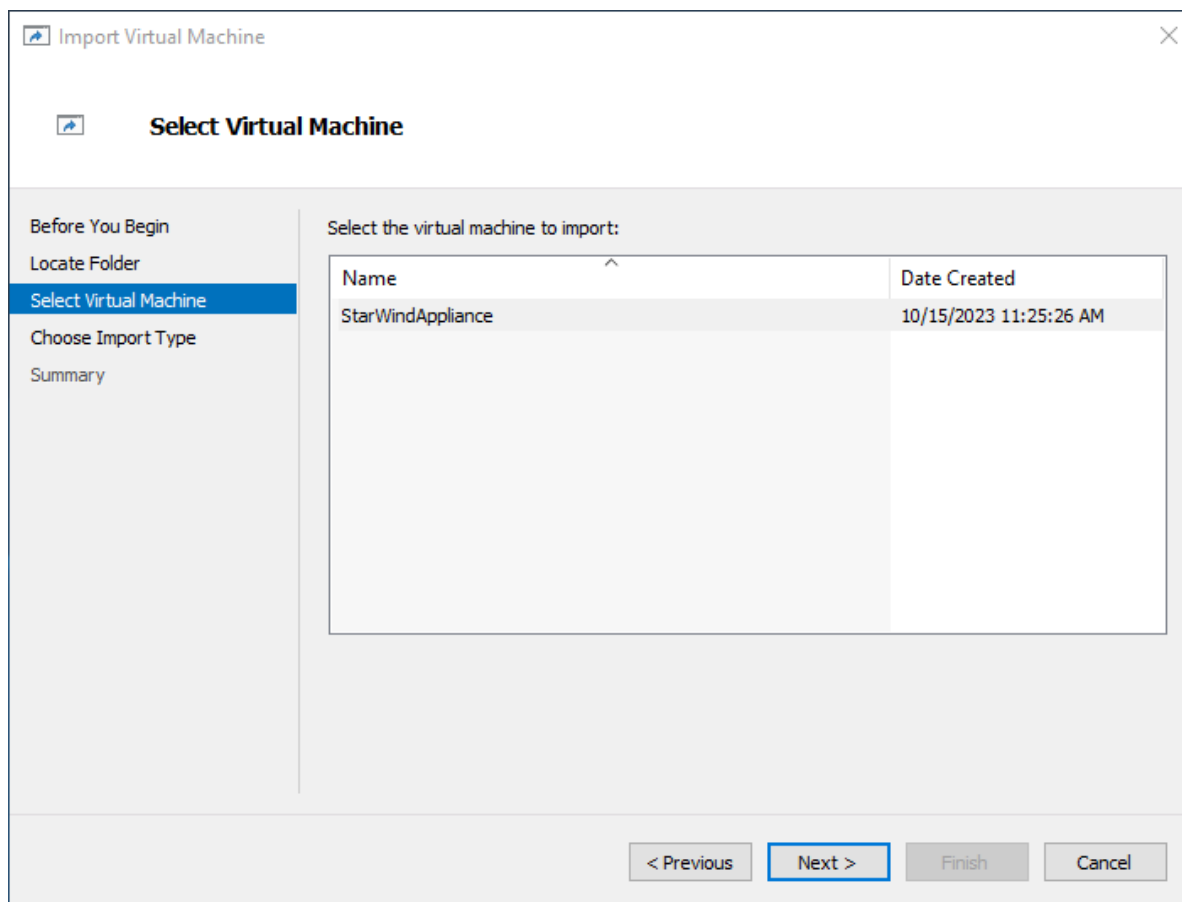

1. Download the zip archive that contains StarWind Virtual SAN CVM
<https://www.starwindsoftware.com/vsan#download>
2. Extract the virtual machine files.
3. Deploy the control virtual machine to the Microsoft Hyper-V Server using the "Import Virtual Machine" wizard in Hyper-V Manager.

4. On the second page of the wizard, point to the location of the VM template. Select the VM folder and click Next.

5. Click Next on the “Select Virtual Machine” step.

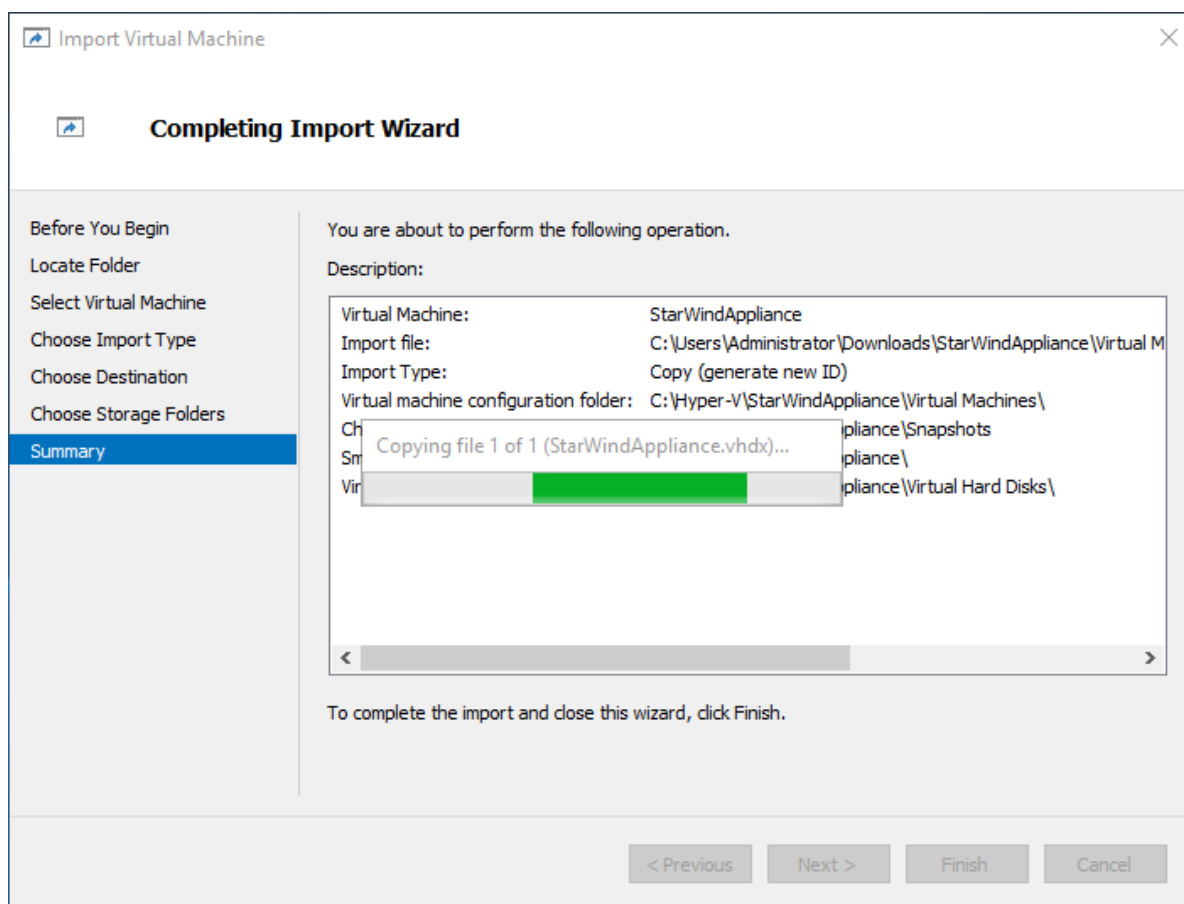

6. Select the “Copy the virtual machine” import type and click Next.

7. Specify new or existing folders to store virtual machine files, such as configuration, snapshots, smart paging, and virtual disk. Click Next.

StarWind Virtual SAN: Configuration Guide for Microsoft Windows Server [Hyper-V], VSAN
Deployed as a Controller Virtual Machine (CVM) using PowerShell CLI

8. In the second step of the wizard, the “VM import” wizard will validate the network.

The default naming for virtual switches:

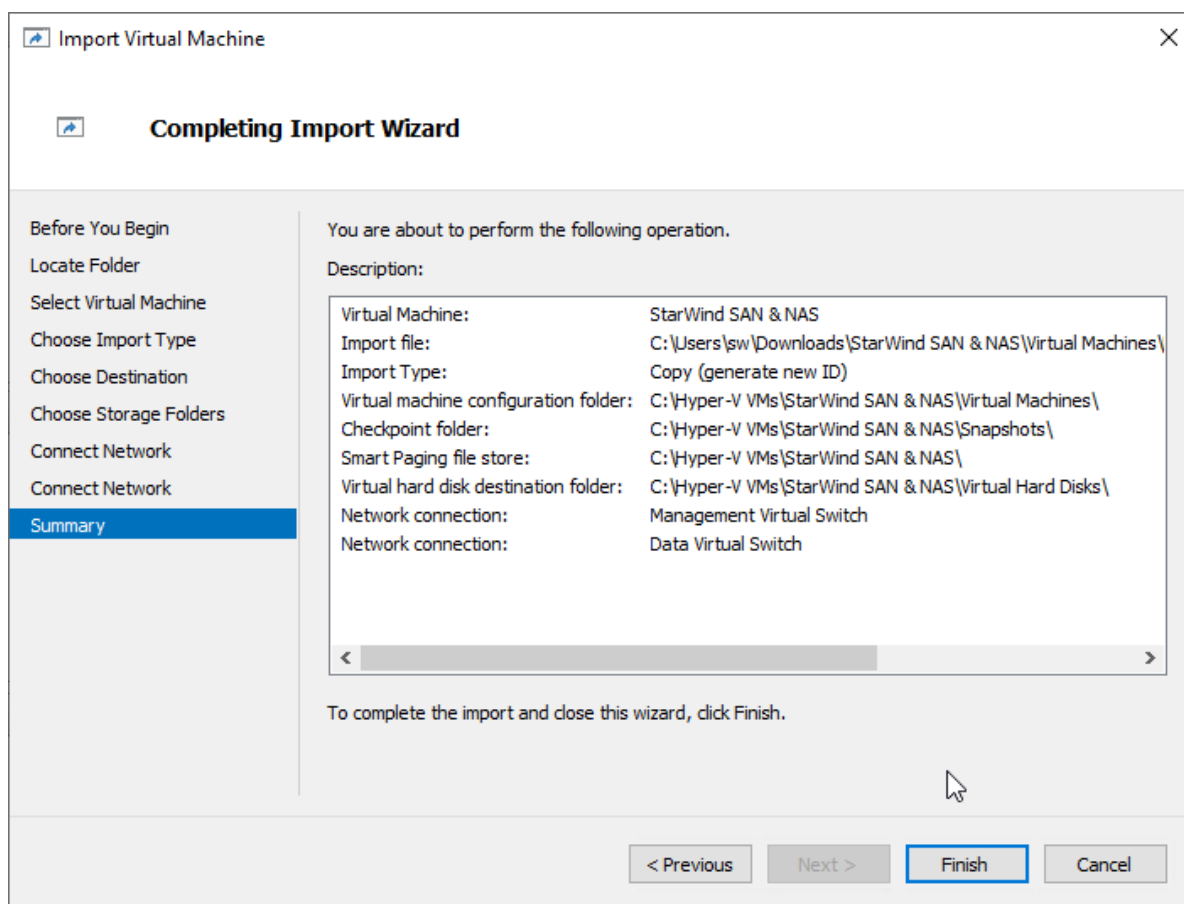

- the Management virtual switch is “Management vSwitch”
- the iSCSI virtual switch is “Data/iSCSI vSwitch”
- the Synchronization virtual switch is “Replication/Sync vSwitch”

If existing virtual switches have different names, specify corresponding network connections. Click Next.

9. Review the import configuration and click Finish to complete the import.

10. Repeat the VM deployment on each partner server which is used for configuring 2-node or 3-node highly available storage according to your licensing.

Initial Configuration Wizard

1. Start StarWind Virtual SAN CVM.
2. Launch VM console to see the VM boot process and get the IPv4 address of the Management network interface.
NOTE: in case VM has no IPv4 address obtained from a DHCP server, use the Text-based User Interface (TUI) to set up a Management network.
3. Using the web browser, open a new tab and enter the VM IPv4 address to open StarWind VSAN Web Interface. Click "Advanced" and then "Continue to..."

Your connection is not private

Attackers might be trying to steal your information from **192.168.12.206** (for example, passwords, messages, or credit cards). [Learn more](#)

NET:ERR_CERT_AUTHORITY_INVALID

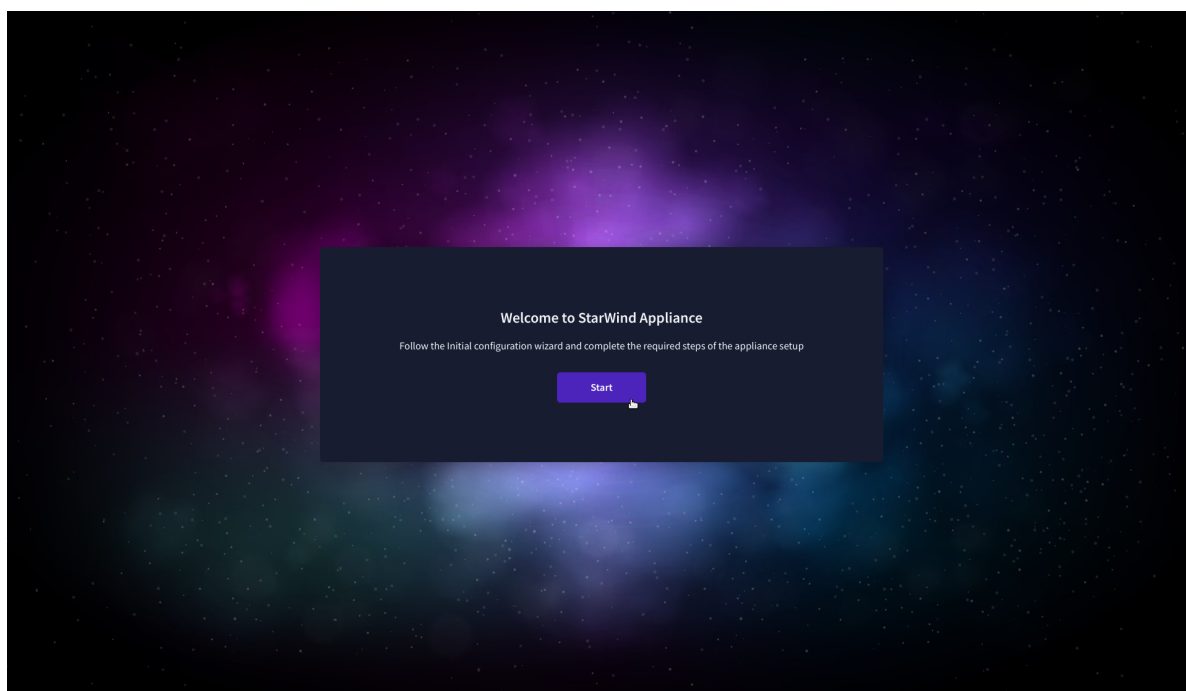

Hide advanced

Back to safety

This server could not prove that it is **192.168.12.206**; its security certificate is not trusted by your computer's operating system. This may be caused by a misconfiguration or an attacker intercepting your connection.

[Proceed to 192.168.12.206 \(unsafe\)](#)

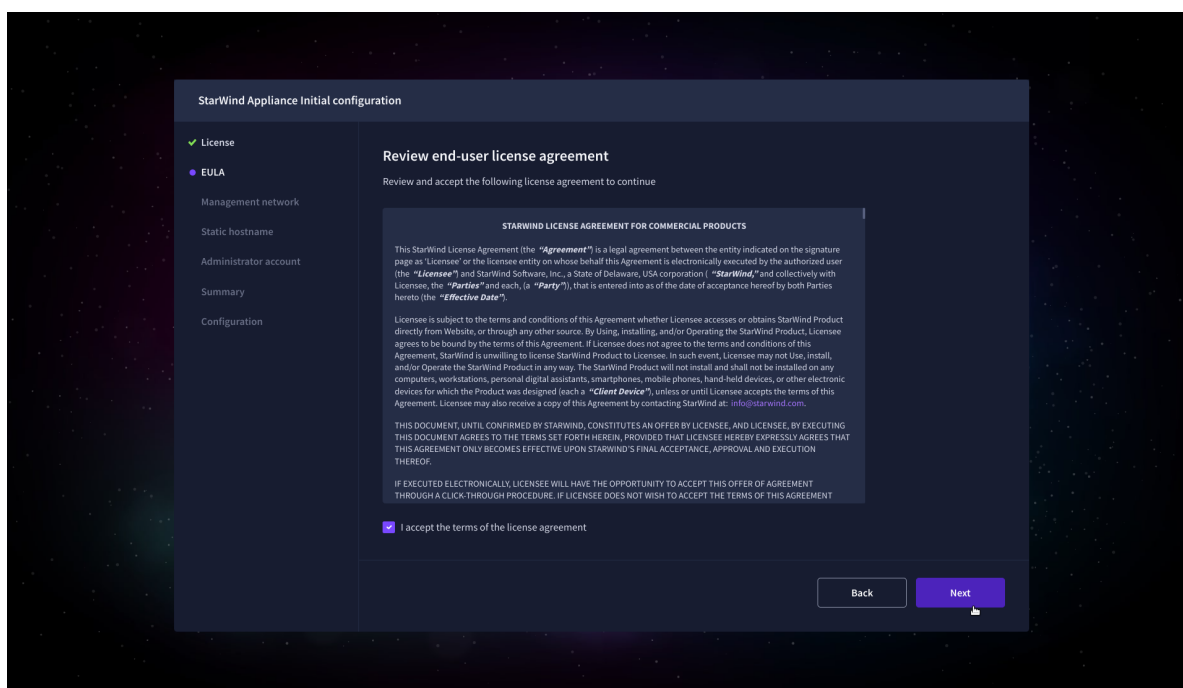

4. StarWind VSAN web UI welcomes you, and the “Initial Configuration” wizard will guide you through the deployment process.

5. In the following step, upload the license file.

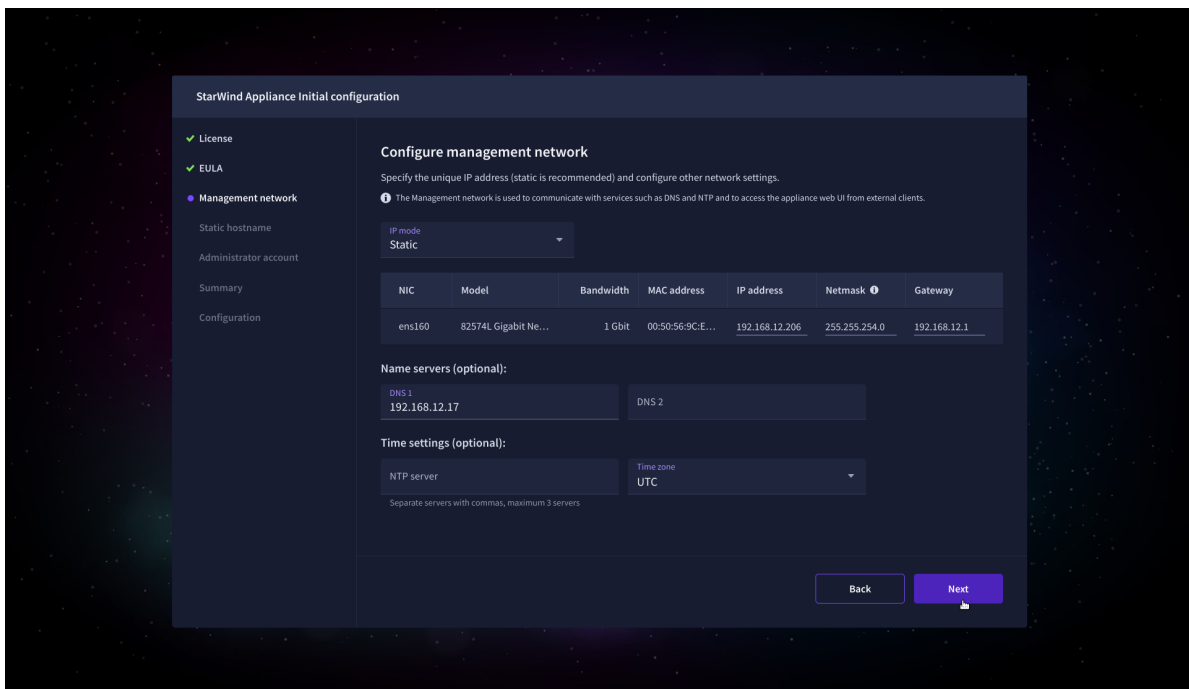

6. Read and accept the End User License Agreement to proceed.

7. Review or edit the Network settings and click Next.

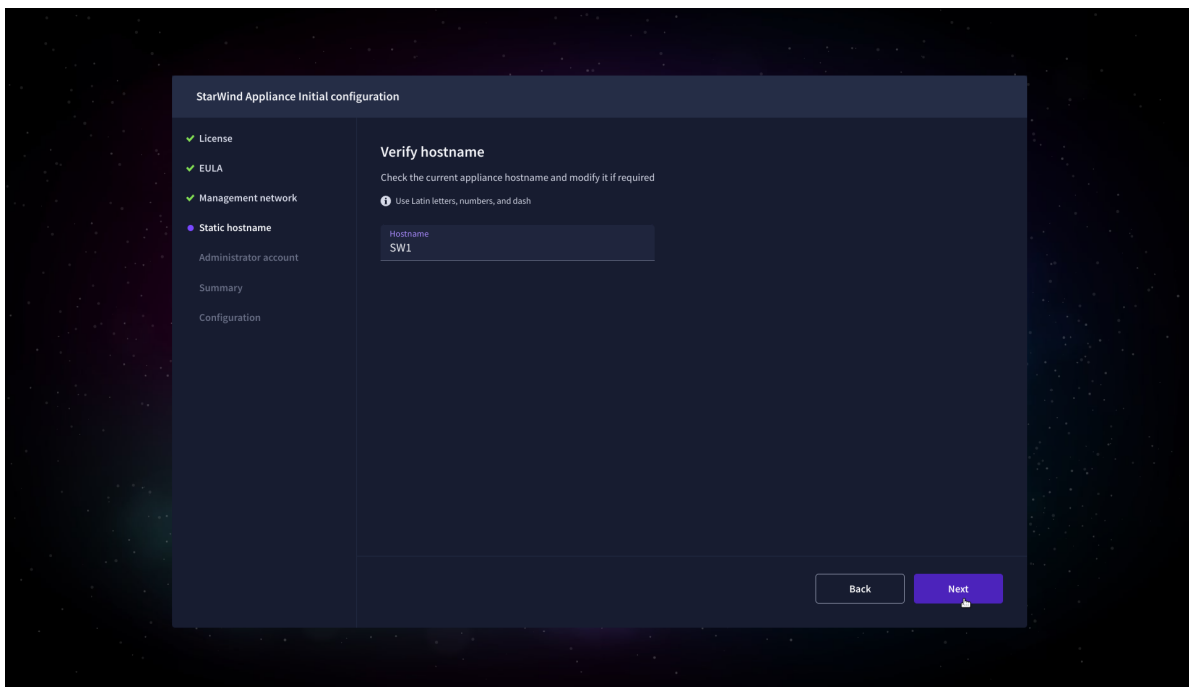

NOTE: Static network settings are recommended for the configuration.

The screenshot shows the 'StarWind Appliance Initial configuration' window. On the left sidebar, the 'Management network' step is selected. The main area is titled 'Configure management network' and includes instructions to specify a unique IP address. A table lists network details for the 'ens160' interface. Below the table, there are optional fields for DNS servers and NTP settings. 'Back' and 'Next' buttons are at the bottom right.

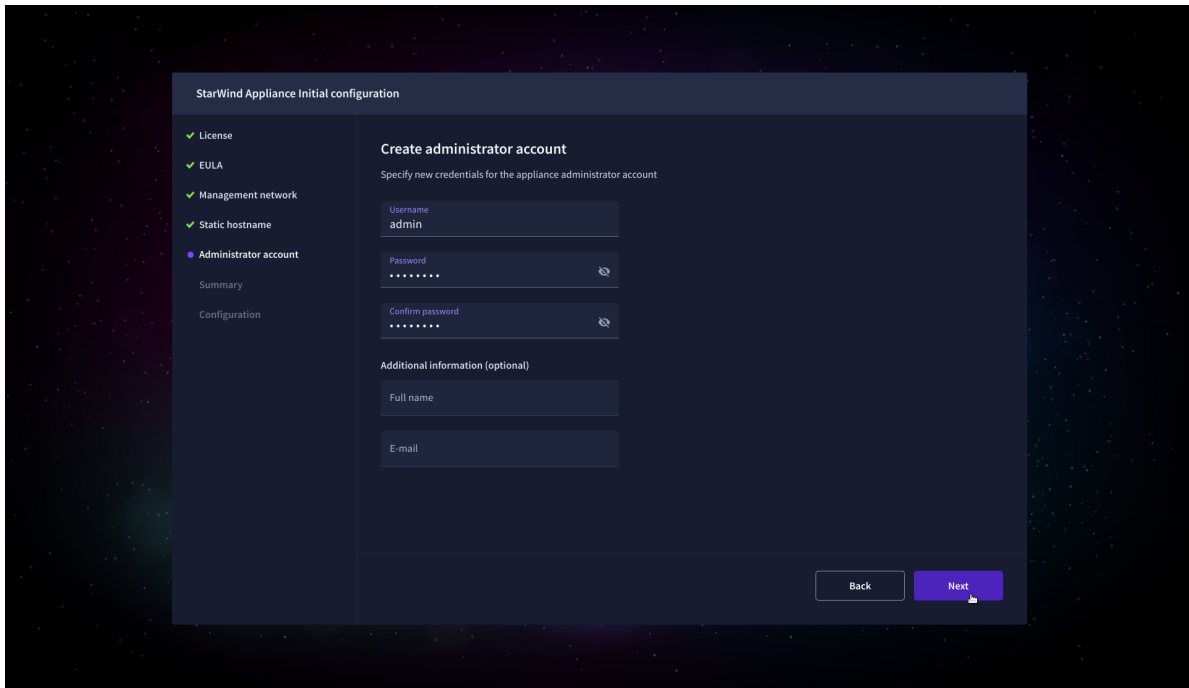

NIC	Model	Bandwidth	MAC address	IP address	Netmask	Gateway
ens160	82574L Gigabit Ne...	1 Gbit	00:50:56:9C:E...	192.168.12.206	255.255.254.0	192.168.12.1

8. Specify the hostname for the virtual machine and click Next.

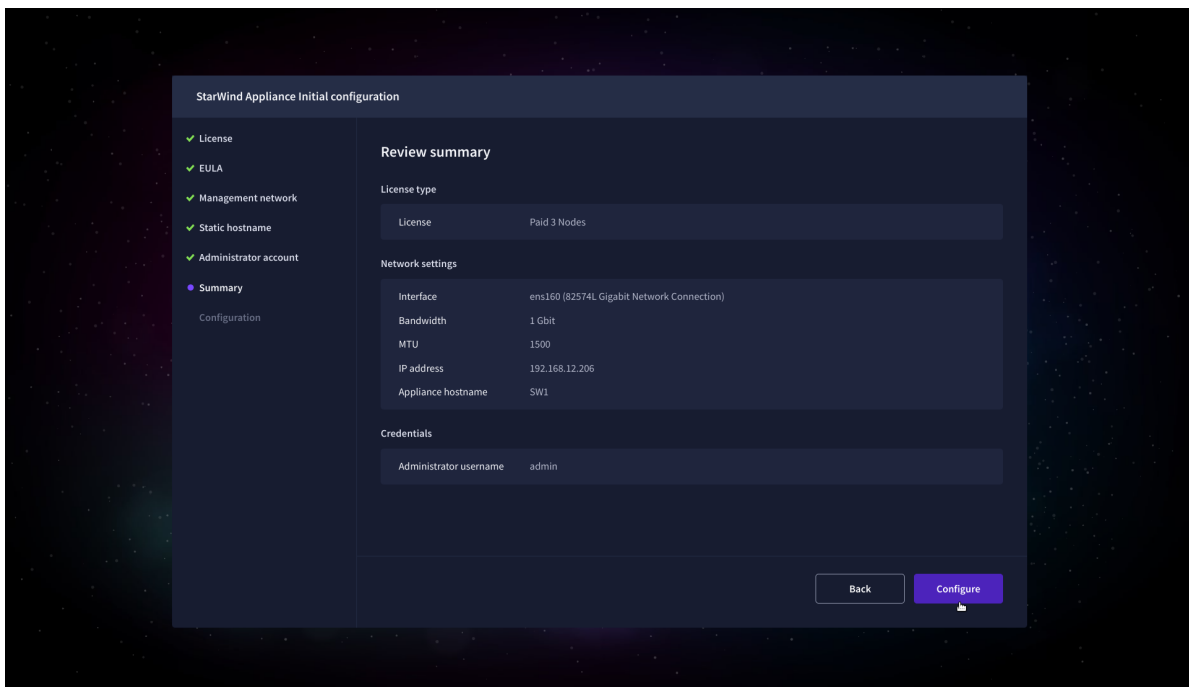

The screenshot shows the 'StarWind Appliance Initial configuration' window. On the left sidebar, the 'Static hostname' step is selected. The main area is titled 'Verify hostname' and includes instructions to check the current appliance hostname. A text field shows the hostname 'SW1'. 'Back' and 'Next' buttons are at the bottom right.

9. Create an administrator account. Click Next.

The screenshot shows the 'StarWind Appliance Initial configuration' window. On the left sidebar, the steps are: License (checked), EULA (checked), Management network (checked), Static hostname (checked), Administrator account (selected), Summary, and Configuration. The main area is titled 'Create administrator account' with the instruction 'Specify new credentials for the appliance administrator account'. It contains three input fields: 'Username' with the value 'admin', 'Password' with masked characters, and 'Confirm password' with masked characters. Below these are optional fields for 'Full name' and 'E-mail'. At the bottom right are 'Back' and 'Next' buttons.

10. Review your settings selection before setting up StarWind VSAN.

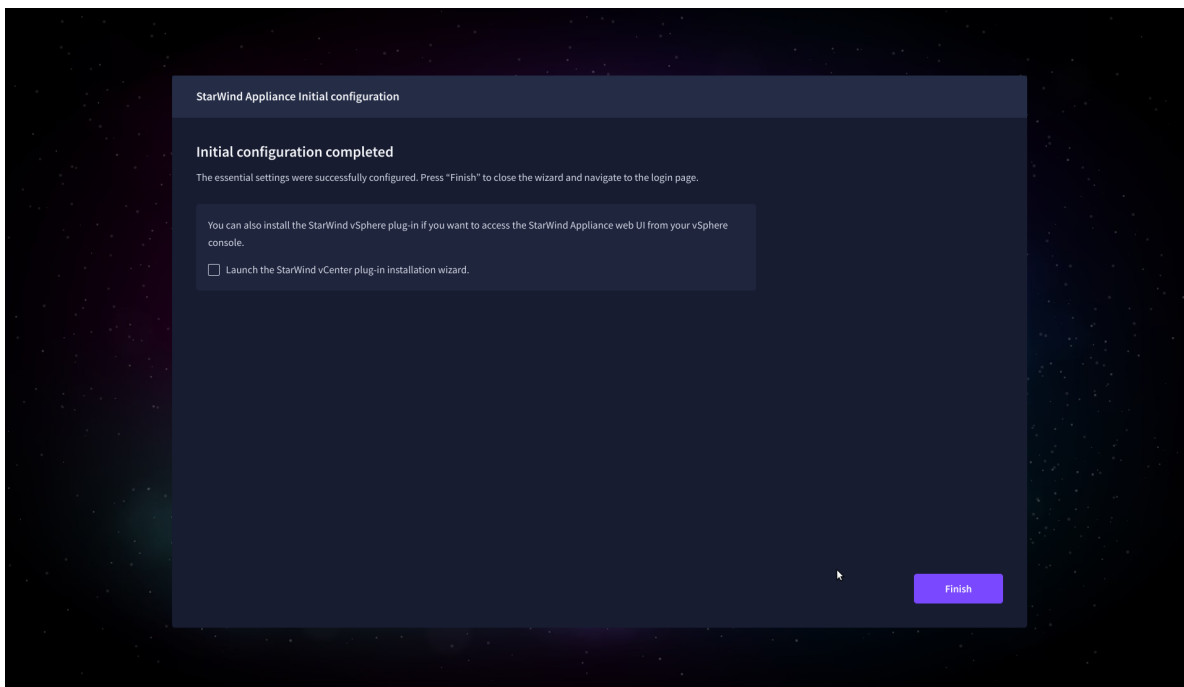

The screenshot shows the 'StarWind Appliance Initial configuration' window at the 'Review summary' step. The left sidebar now has 'Summary' selected. The main area is titled 'Review summary' and contains three sections: 'License type' showing 'License' and 'Paid 3 Nodes'; 'Network settings' showing a table with Interface (ens160 (82574L Gigabit Network Connection)), Bandwidth (1 Gbit), MTU (1500), IP address (192.168.12.206), and Appliance hostname (SW1); and 'Credentials' showing 'Administrator username' as 'admin'. At the bottom right are 'Back' and 'Configure' buttons.

11. Please standby until the Initial Configuration Wizard configures StarWind VSAN for you.

12. The appliance is set and ready. Click on the Done button to install the StarWind vCenter Plugin right now or uncheck the checkbox to skip this step and proceed to the [Login page](#).

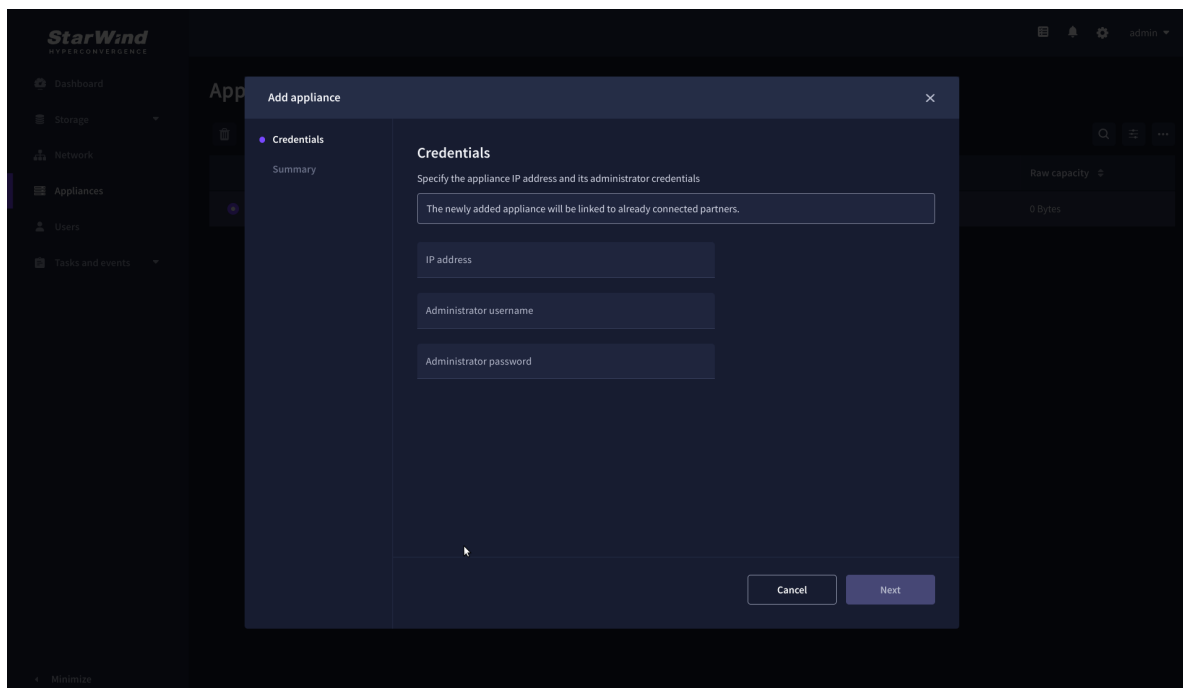

13. Repeat the initial configuration on other StarWind CVMs that will be used to create 2-node or 3-node HA shared storage.

Add Appliance

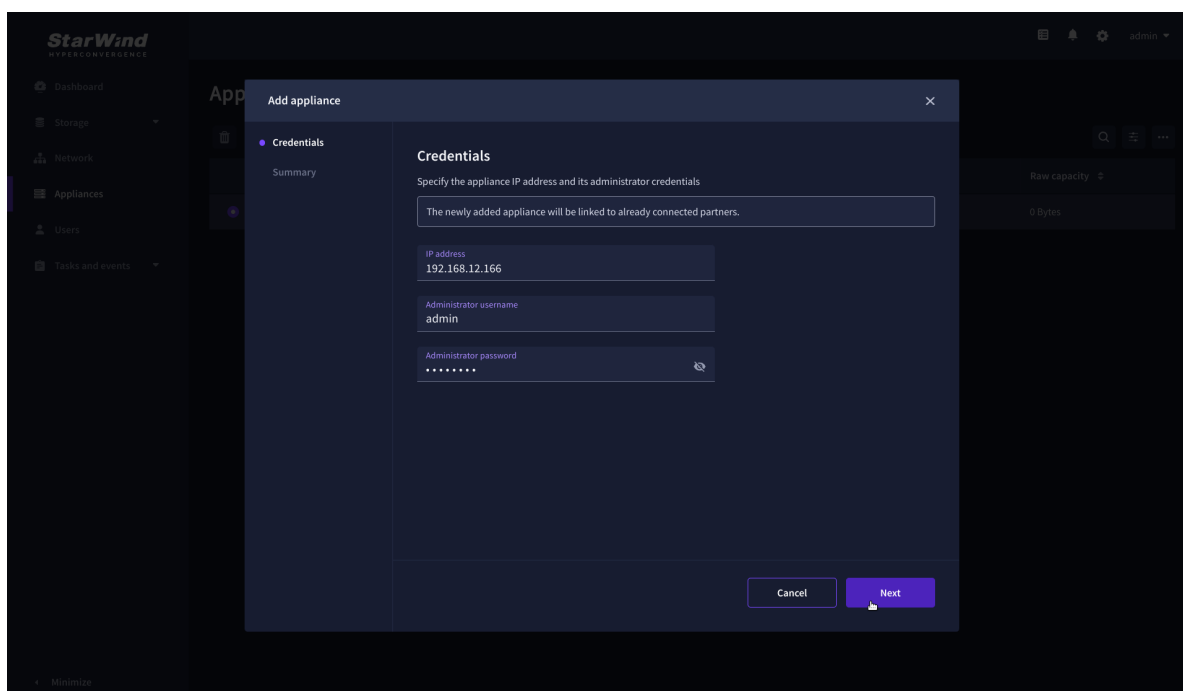

To create 2-way or 3-way synchronously replicated highly available storage, add partner appliances that use the same license key.

1. Add StarWind appliance(s) in the web console, on the Appliances page.

NOTE: The newly added appliance will be linked to already connected partners.

2. Provide credentials of partner appliance.

3. Wait for connection and validation of settings.

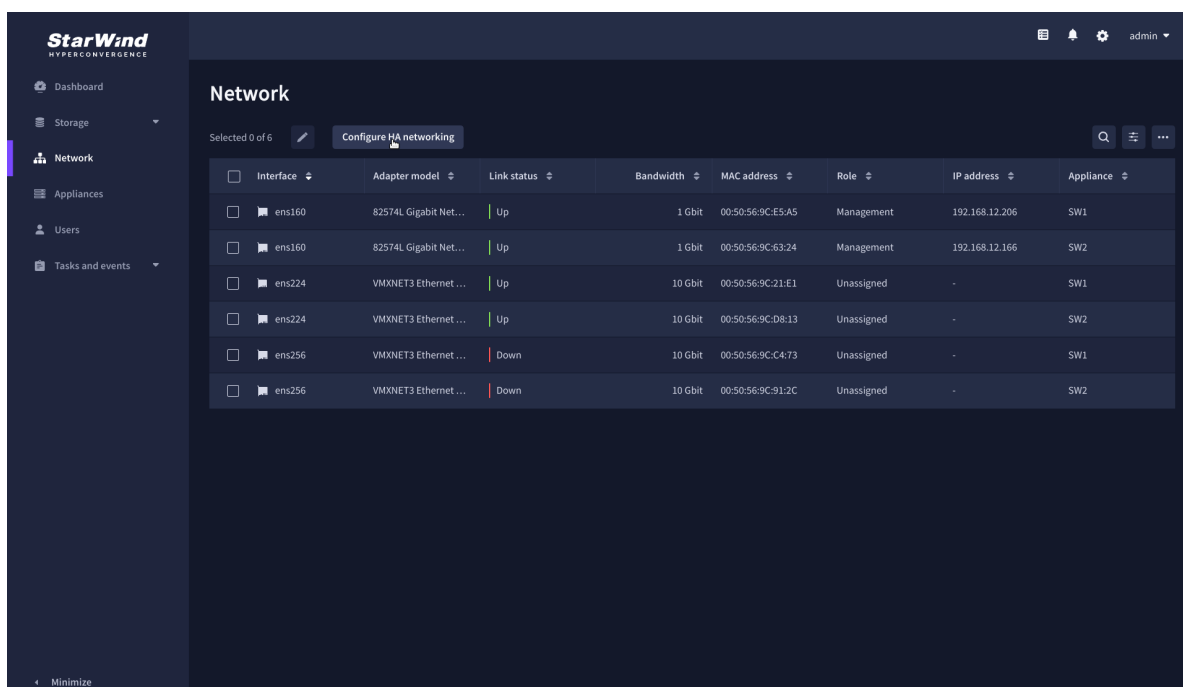

4. Review the summary and click “Add appliance”.

Configure Ha Networking

1. Launch the “Configure HA Networking” wizard.

2. Select appliances for network configuration.

NOTE: the number of appliances to select is limited by your license, so can be either two or three appliances at a time.

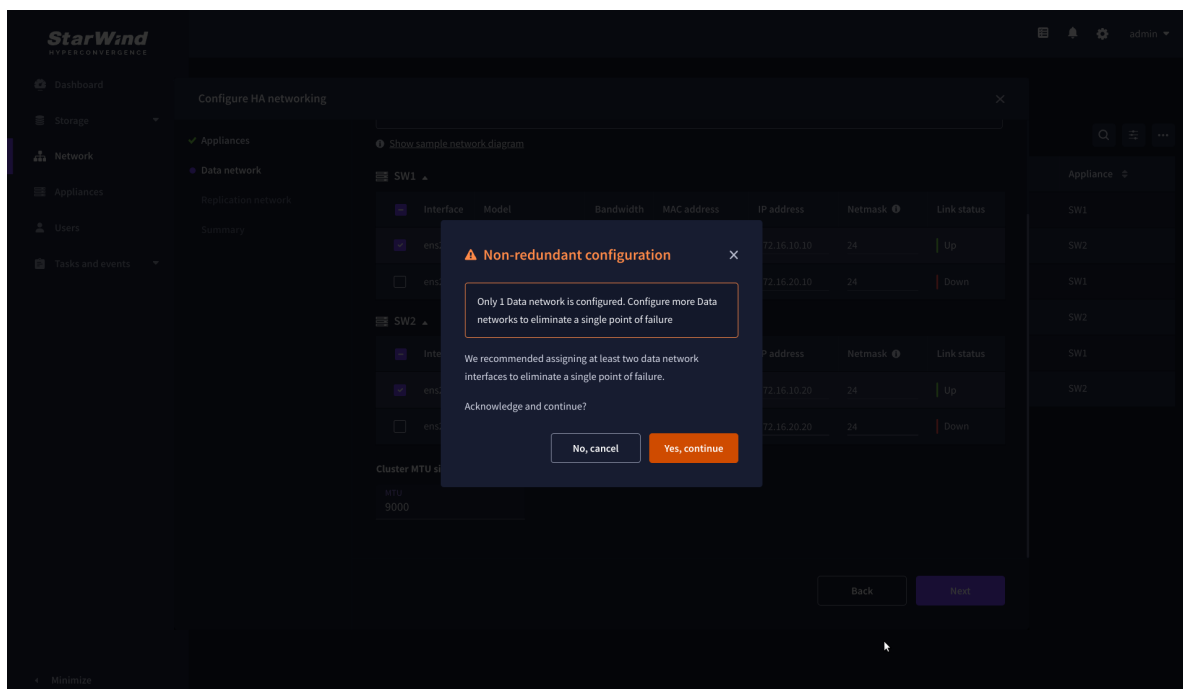

3. Configure the “Data” network. Select interfaces to carry storage traffic, configure them with static IP addresses in unique networks, and specify subnet masks:

- assign and configure at least one interface on each node
- for redundant configuration, select two interfaces on each node
- ensure interfaces are connected to client hosts directly or through redundant switches

4. Assign MTU value to all selected network adapters, e.g. 1500 or 9000. Ensure the switches have the same MTU value set.

5. Click Next to validate Data network settings.

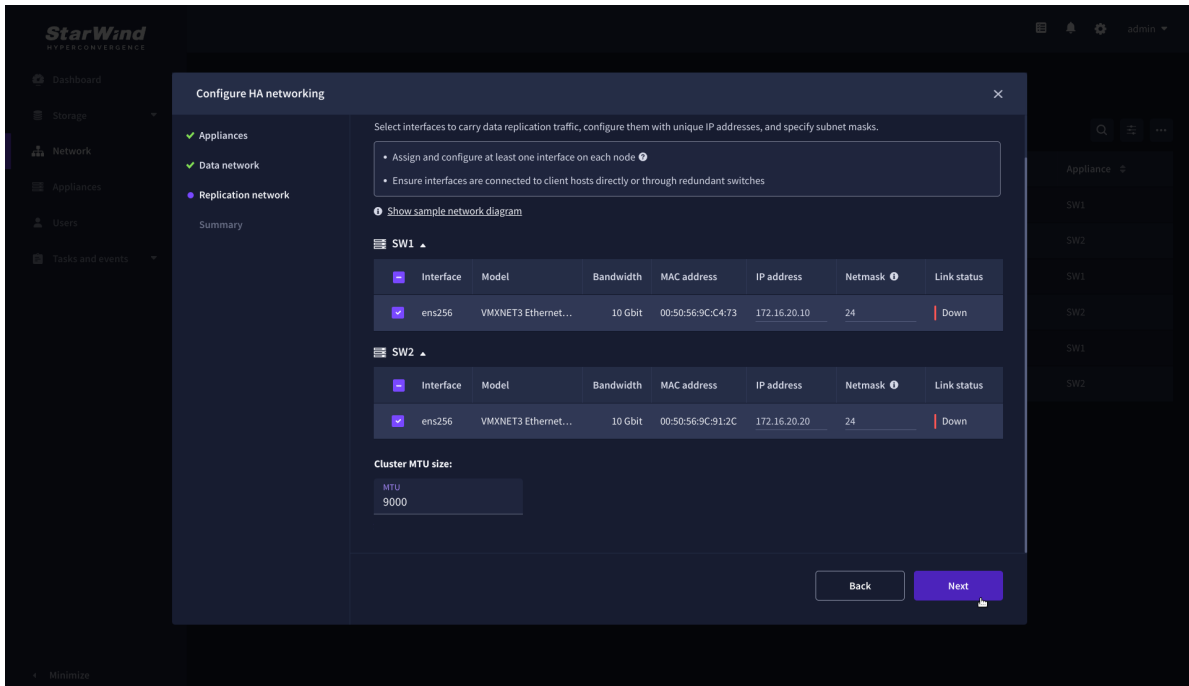

6. Configure the “Replication” network. Select interfaces to carry storage traffic, configure them with static IP addresses in unique networks, and specify subnet masks:

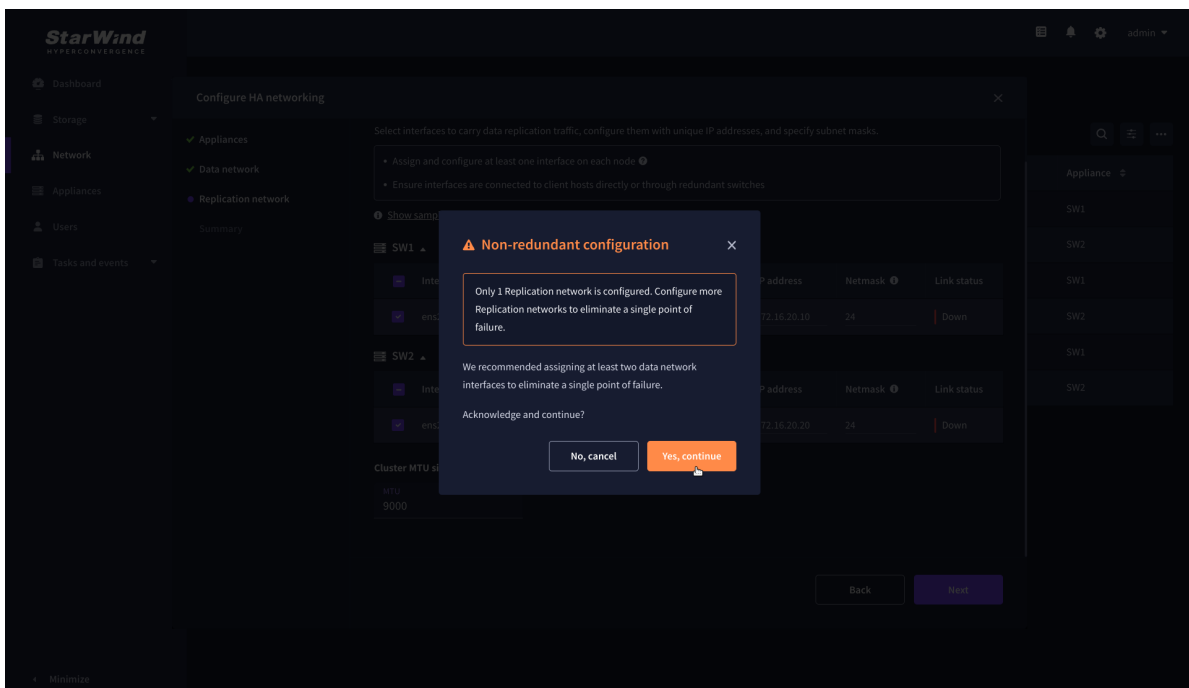

- assign and configure at least one interface on each node
- for redundant configuration, select two interfaces on each node

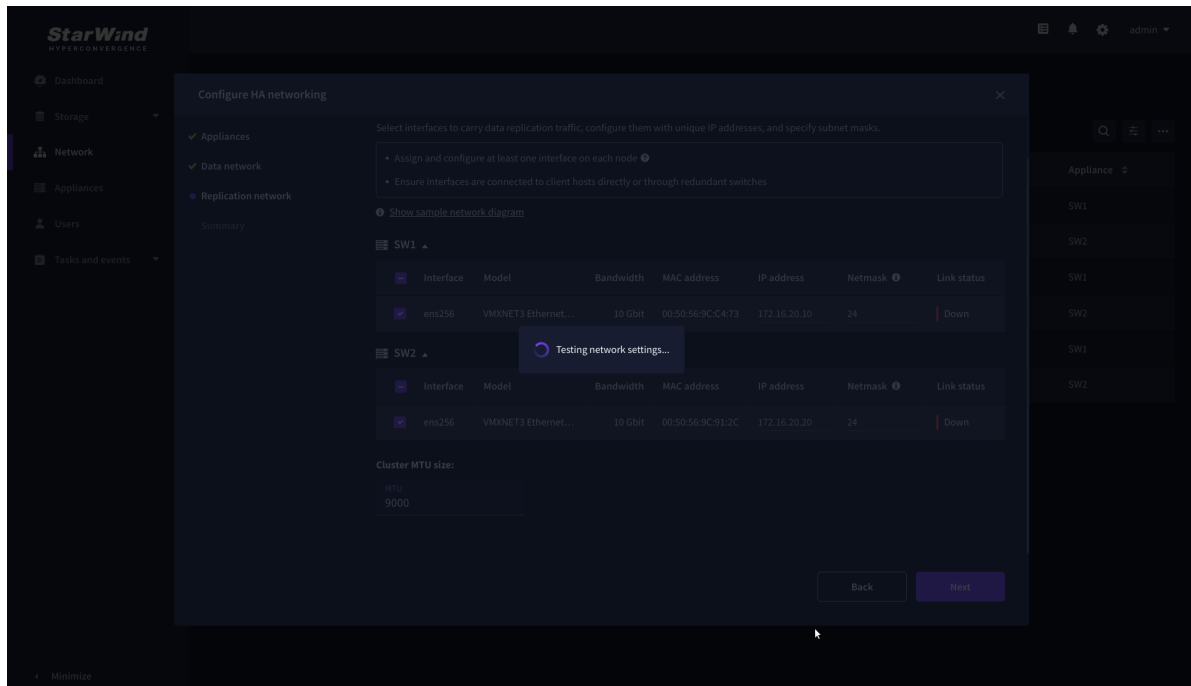

- ensure interfaces are connected to client hosts directly or through redundant switches

7. Assign MTU value to all selected network adapters, e.g. 1500 or 9000. Ensure the switches have the same MTU value set.

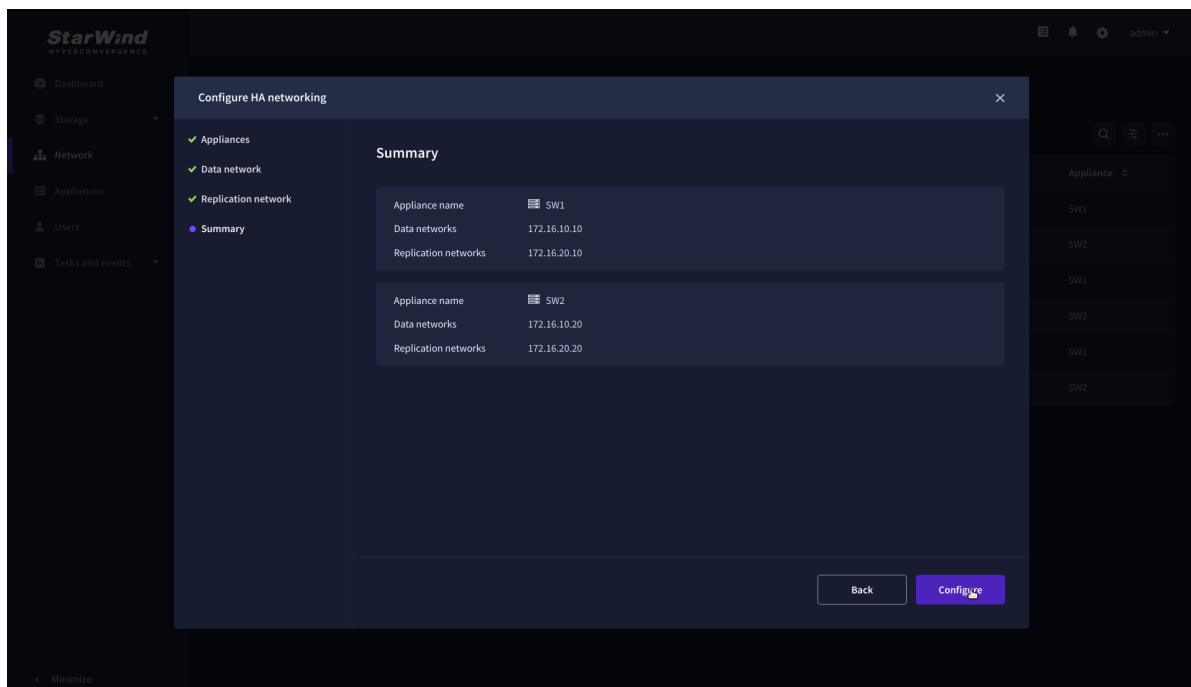

8. Click Next to validate the Replication network settings completion.

9. Review the summary and click Configure.

Add Physical Disks

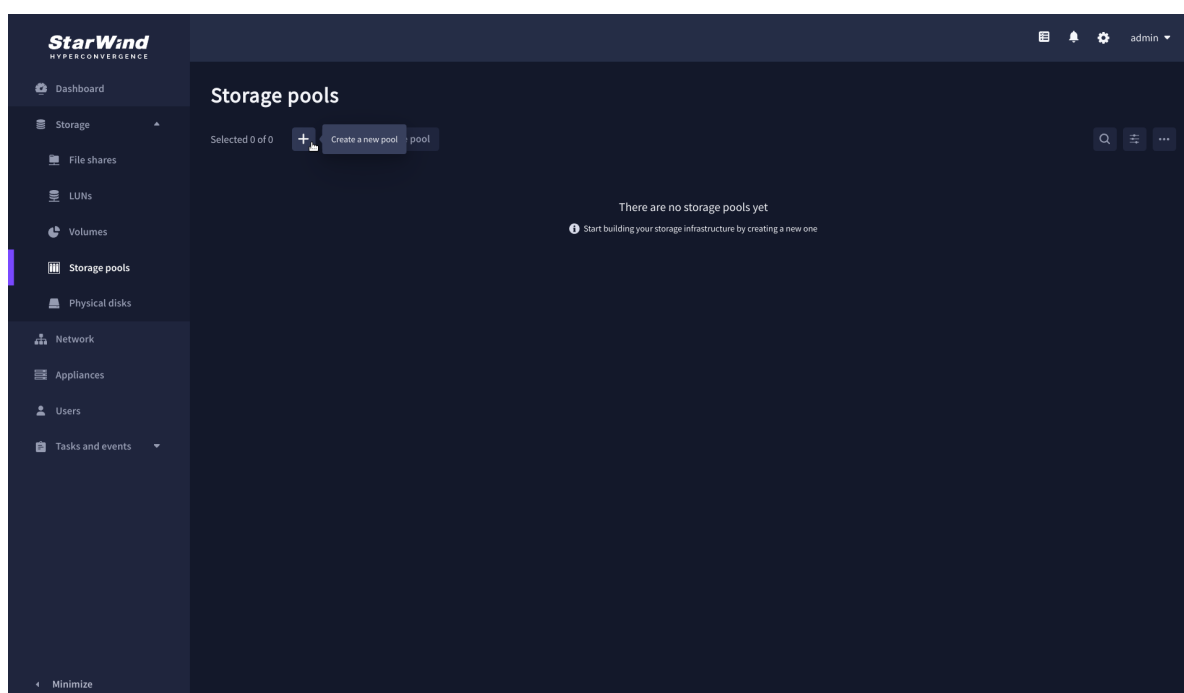

Attach physical storage to StarWind Virtual SAN Controller VM:

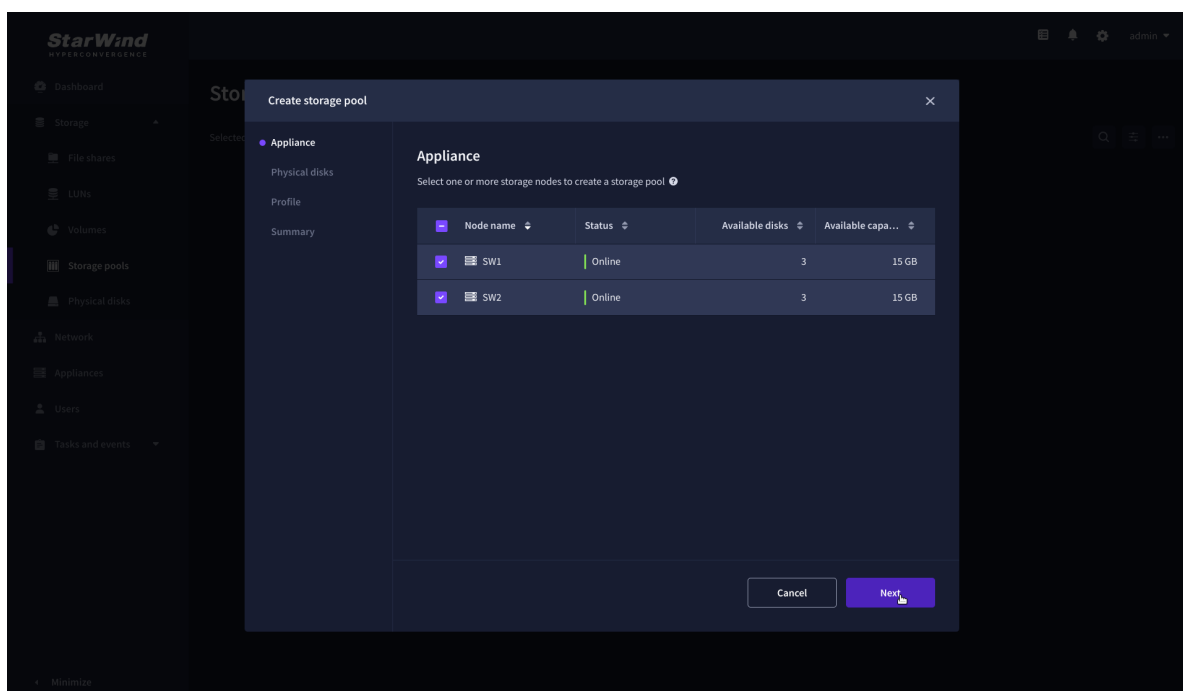

- Ensure that all physical drives are connected through an HBA or RAID controller.
- Deploy StarWind VSAN CVM on each server that will be used to configure fault-tolerant standalone or highly available storage.
- Store StarWind VSAN CVM on a separate storage device accessible to the hypervisor host (e.g., SSD, HDD).
- Add HBA, RAID controllers, or NVMe SSD drives to StarWind CVM via a passthrough device.

Learn more about storage provisioning guidelines in the [KB article](#).

Create Storage Pool

1. Click the “Add” button to create a storage pool.
2. Select two storage nodes to create a storage pool on them simultaneously.

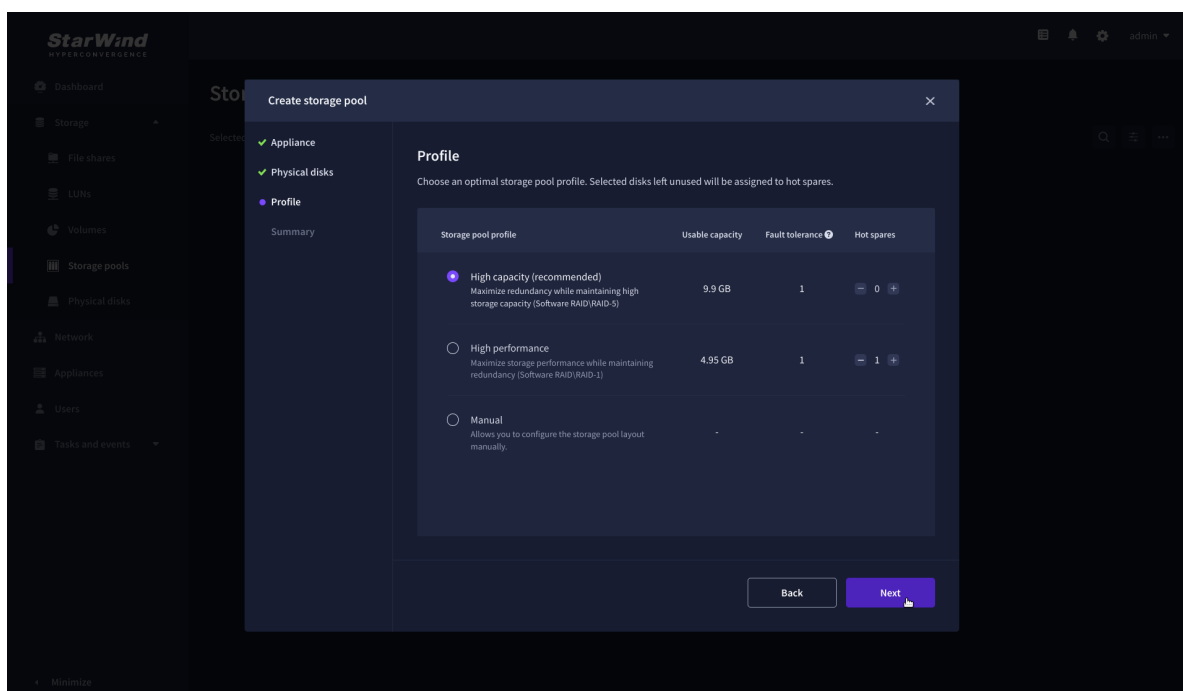

3. Select physical disks to include in the storage pool name and click the “Next” button.
NOTE: Select identical type and number of disks on each storage node to create identical storage pools.

4. Select one of the preconfigured storage profiles or create a redundancy layout for the new storage pool manually according to your redundancy, capacity, and performance requirements.

Hardware RAID, Linux Software RAID, and ZFS storage pools are supported and integrated into the StarWind CVM web interface. To make easier the storage pool configuration, the preconfigured storage profiles are provided to configure the recommended pool type and layout according to the direct-attached storage:

- hardware RAID – configures Hardware RAID’s virtual disk as a storage pool. It is available only if a hardware RAID controller is passed through to the CVM
- high performance – creates Linux Software RAID-10 to maximize storage performance while maintaining redundancy
- high capacity – creates Linux Software RAID-5 to maximize storage capacity while maintaining redundancy
- better redundancy – creates ZFS Stripped RAID-Z2 (RAID 60)) to maximize redundancy while maintaining high storage capacity
- manual – allows users to configure any storage pool type and layout with attached storage

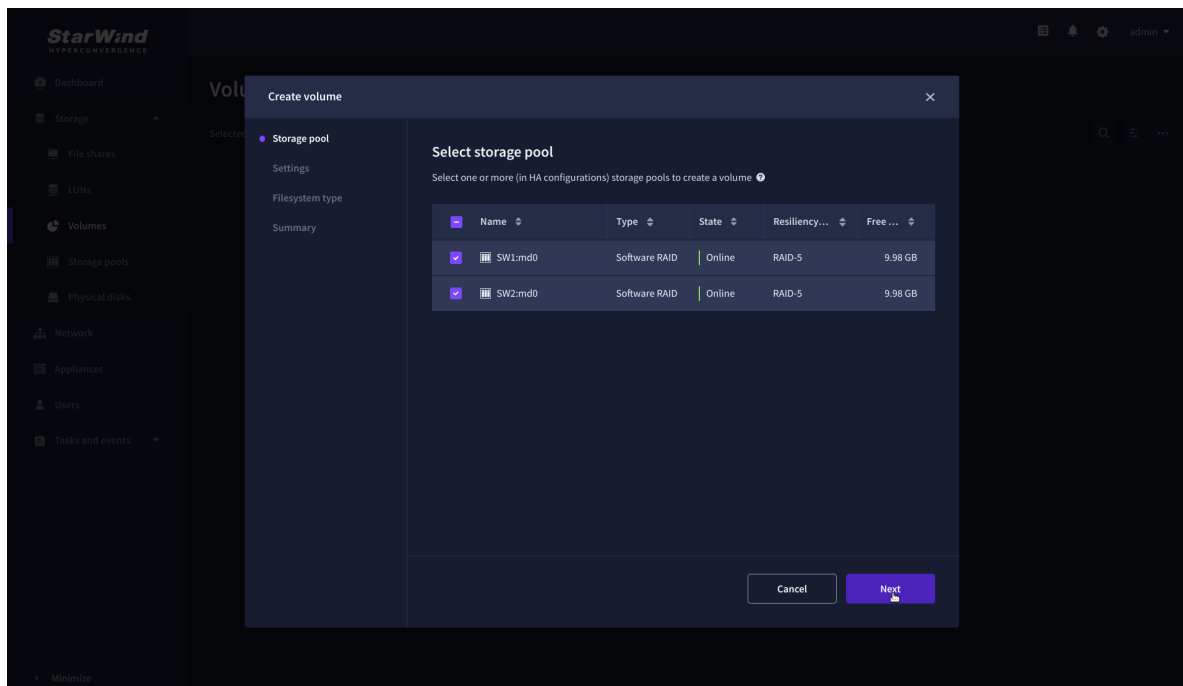

5. Review “Summary” and click the “Create” button to create the pools on storage servers simultaneously.

Create Volume

1. To create volumes, click the “Add” button.
2. Select two identical storage pools to create a volume simultaneously.

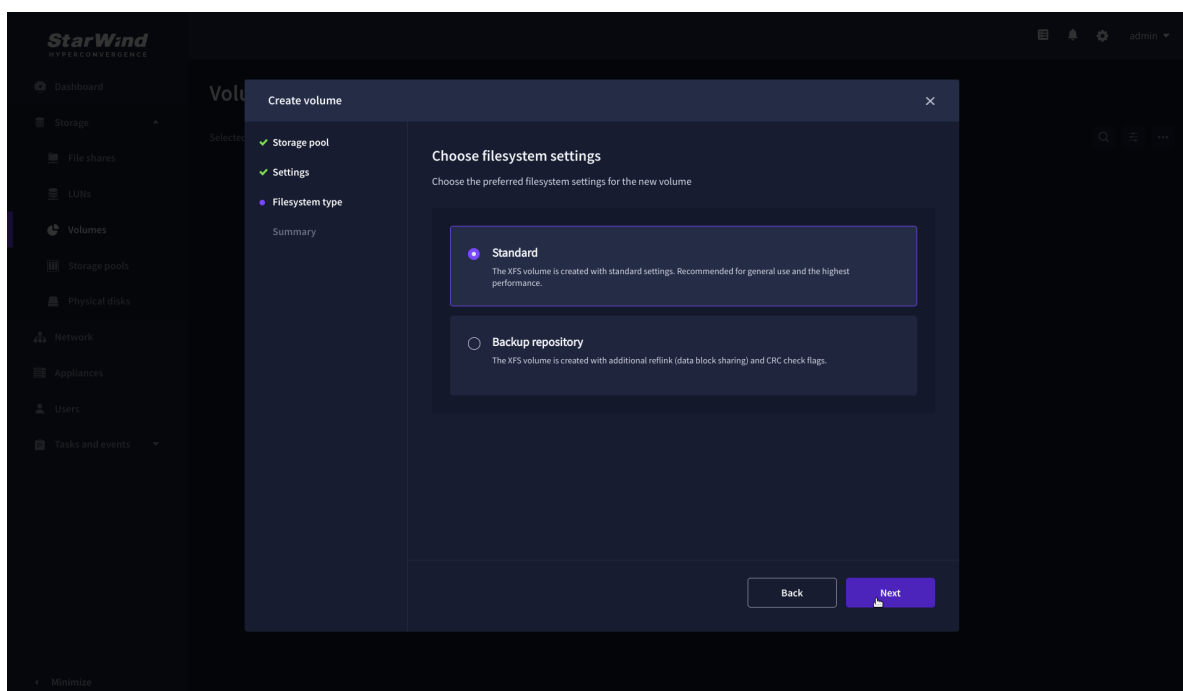

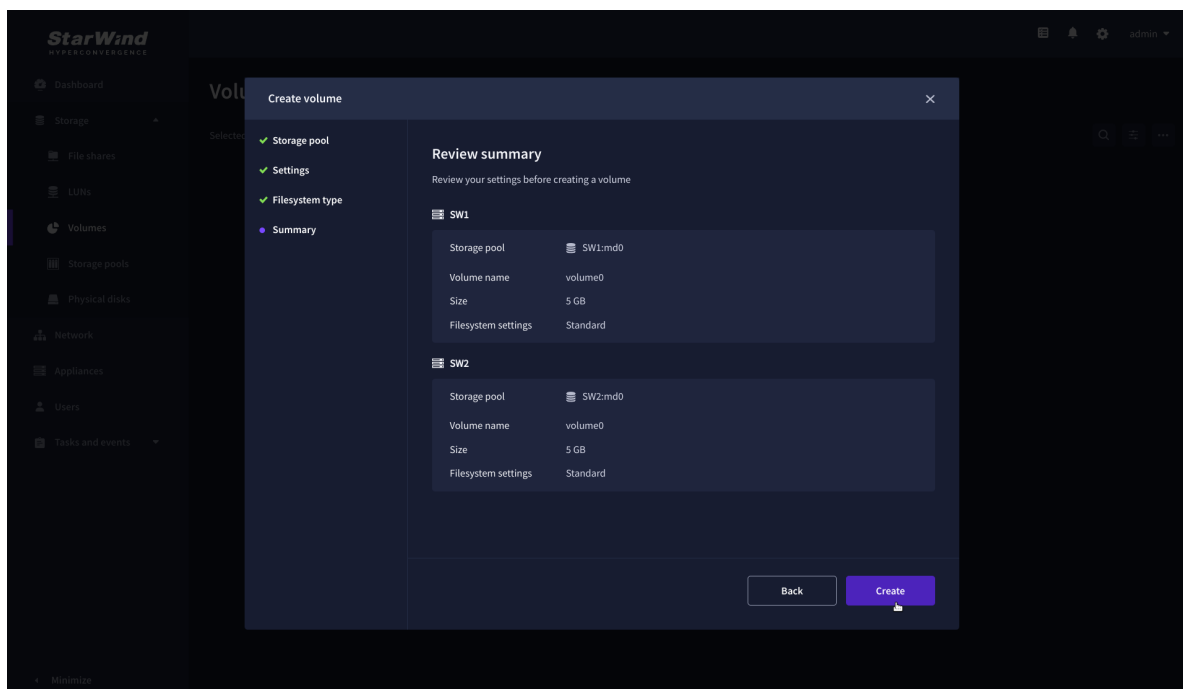

3. Specify volume name and capacity.

4. Select the Standard volume type.

5. Review “Summary” and click the “Create” button to create the pool.

Install Powershell Samples

1. Open Settings and go to the Downloads tab.

2. Click Download samples to download the installer to any Windows machine.

3. Run the downloaded installation file.
4. Choose “Install StarWindX” to install the StarWindX PowerShell IDE and sample scripts.

Creating Starwind Ha Luns Using Powershell

1. Open PowerShell ISE as Administrator.
2. Open StarWindX sample CreateHA_2.ps1 using PowerShell ISE. It can be found here:
C:\Program Files\StarWind Software\StarWind\StarWindX\Samples\

```

Detailed explanation of script parameters:

-addr, -addr2 — partner nodes IP address.

Format: string. Default value: 192.168.0.1, 192.168.0.1

allowed values: localhost, IP-address

-port, -port2 — local and partner node port.

Format: string. Default value: 3261

-user, -user2 — local and partner node user name.

Format: string. Default value: root

-password, -password2 — local and partner node user password.

Format: string. Default value: starwind

#common

-initMethod -

Format: string. Default value: Clear

-size - set size for HA-devcie (MB)

Format: integer. Default value: 12

-sectorSize - set sector size for HA-device

Format: integer. Default value: 512

allowed values: 512, 4096

-failover – set type failover strategy
Format: integer. Default value: 0 (Heartbeat)
allowed values: 0, 1 (Node Majority)

-bmpType – set bitmap type, is set for both partners at once
Format: integer. Default value: 1 (RAM)
allowed values: 1, 2 (DISK)

-bmpStrategy – set journal strategy, is set for both partners at once
Format: integer. Default value: 0
allowed values: 0, 1 – Best Performance (Failure), 2 – Fast Recovery (Continuous)

#primary node

-imagePath – set path to store the device file
Format: string. Default value: My computer\C\starwind". For Linux the following format should be used: "VSA Storage\mnt\mount_point"

-imageName – set name device
Format: string. Default value: masterImg21

-createImage – set create image file
Format: boolean. Default value: true

-targetAlias – set alias for target
Format: string. Default value: targetha21

-poolName – set storage pool
Format: string. Default value: pool1

-aluaOptimized – set Alua Optimized
Format: boolean. Default value: true

-cacheMode – set type L1 cache (optional parameter)
Format: string. Default value: wb
allowed values: none, wb, wt

-cacheSize – set size for L1 cache in MB (optional parameter)
Format: integer. Default value: 128
allowed values: 1 and more

-syncInterface – set sync channel IP-address from partner node
Format: string. Default value: "#p2={0}:3260"

-hbInterface – set heartbeat channel IP-address from partner node
Format: string. Default value: ""

-createTarget – set creating target
Format: string. Default value: true
Even if you do not specify the parameter -createTarget, the target will be created automatically.
If the parameter is set as -createTarget \$false, then an attempt will be made to create the device with existing targets, the names of which are specified in the -targetAlias (targets must already be created)

-bmpFolderPath – set path to save bitmap file
Format: string.

#secondary node

-imagePath2 – set path to store the device file

Format: string. Default value: “My computer\C\starwind”. For Linux the following format should be used: “VSA Storage\mnt\mount_point”

-imageName2 – set name device

Format: string. Default value: masterImg21

-createImage2 – set create image file

Format: boolean. Default value: true

-targetAlias2 – set alias for targetFormat: string.

Default value: targetha22

-poolName2 – set storage pool

Format: string. Default value: pool1

-aluaOptimized2 – set Alua Optimized

Format: boolean. Default value: true

-cacheMode2 – set type L1 cache (optional parameter)

Format: string. Default value: wb

allowed values: wb, wt

-cacheSize2 – set size for L1 cache in MB (optional parameter)

Format: integer. Default value: 128

allowed values: 1 and more

-syncInterface2 – set sync channel IP-address from partner node

Format: string. Default value: “#p1={0}:3260”

-hbInterface2 – set heartbeat channel IP-address from partner node

Format: string. Default value: “”

-createTarget2 – set creating target

Format: string. Default value: true

Even if you do not specify the parameter -createTarget, the target will be created automatically.If the parameter is set as -createTarget \$false, then an attempt will be made to create the device with existing targets, the names of which are specified in the -targetAlias (targets must already be created)

-bmpFolderPath2 – set path to save bitmap file

Format: string.

Selecting The Failover Strategy

StarWind provides 2 options for configuring a failover strategy:

Heartbeat

The Heartbeat failover strategy allows avoiding the “split-brain” scenario when the HA cluster nodes are unable to synchronize but continue to accept write commands from the

initiators independently. It can occur when all synchronization and heartbeat channels disconnect simultaneously, and the partner nodes do not respond to the node's requests. As a result, StarWind service assumes the partner nodes to be offline and continues operations on a single-node mode using data written to it.

If at least one heartbeat link is online, StarWind services can communicate with each other via this link. The device with the lowest priority will be marked as not synchronized and get subsequently blocked for the further read and write operations until the synchronization channel resumption. At the same time, the partner device on the synchronized node flushes data from the cache to the disk to preserve data integrity in case the node goes down unexpectedly. It is recommended to assign more independent heartbeat channels during the replica creation to improve system stability and avoid the "split-brain" issue.

With the heartbeat failover strategy, the storage cluster will continue working with only one StarWind node available.

Node Majority

The Node Majority failover strategy ensures the synchronization connection without any additional heartbeat links. The failure-handling process occurs when the node has detected the absence of the connection with the partner.

The main requirement for keeping the node operational is an active connection with more than half of the HA device's nodes. Calculation of the available partners is based on their "votes".

In case of a two-node HA storage, all nodes will be disconnected if there is a problem on the node itself, or in communication between them. Therefore, the Node Majority failover strategy requires the addition of the third Witness node or file share (SMB) which participates in the nodes count for the majority, but neither contains data on it nor is involved in processing clients' requests. In case an HA device is replicated between 3 nodes, no Witness node is required.

With Node Majority failover strategy, failure of only one node can be tolerated. If two nodes fail, the third node will also become unavailable to clients' requests.

Please select the required option:

Provisioning Starwind Ha Storage To Windows Server Hosts

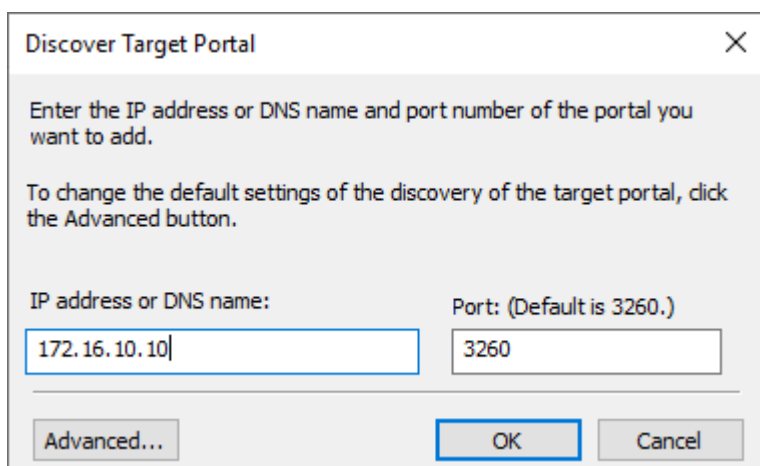

1. Launch Microsoft iSCSI Initiator: Start -> Windows Administrative Tools -> iSCSI Initiator. Alternatively, launch it using the command below in the command line interface:

```
iscsicpl
```

2. Navigate to the Discovery tab.

3. Click the Discover Portal button. The Discover Target Portal dialog appears. Type 172.16.10.10.

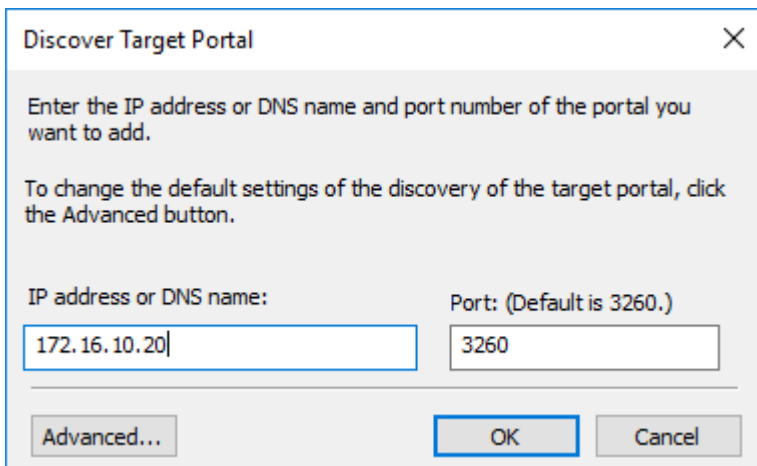

The image shows a 'Discover Target Portal' dialog box. It has a title bar with a close button (X). The main text area contains instructions: 'Enter the IP address or DNS name and port number of the portal you want to add.' and 'To change the default settings of the discovery of the target portal, click the Advanced button.' Below this, there are two input fields: 'IP address or DNS name:' with the value '172.16.10.10' and 'Port: (Default is 3260.)' with the value '3260'. At the bottom, there are three buttons: 'Advanced...', 'OK', and 'Cancel'.

4. Click the Advanced button. Select Microsoft iSCSI Initiator as a Local adapter and select Initiator IP. Confirm the actions to complete the Target Portal discovery.

The screenshot shows the 'Advanced Settings' dialog box with the 'IPsec' tab selected. The 'Connect using' section has three dropdown menus: 'Local adapter' set to 'Microsoft iSCSI Initiator', 'Initiator IP' set to '172.16.10.1', and 'Target portal IP' which is empty. Below this, the 'CRC / Checksum' section has two unchecked checkboxes: 'Data digest' and 'Header digest'. The 'Enable CHAP log on' checkbox is also unchecked. The 'CHAP Log on information' section contains a text box for 'Name' with the value 'iqn.1991-05.com.microsoft:sw01' and an empty 'Target secret' text box. At the bottom, there are three unchecked checkboxes: 'Perform mutual authentication', 'Use RADIUS to generate user authentication credentials', and 'Use RADIUS to authenticate target credentials'. The 'OK' button is highlighted with a blue border.

5. Click the Discover Portal... button once again.

6. In Discover Target Portal dialog, type in the iSCSI interface IP address of the partner node that will be used to connect the StarWind provisioned targets. Click Advanced.

The image shows a 'Discover Target Portal' dialog box. It has a title bar with a close button (X). The main area contains instructions: 'Enter the IP address or DNS name and port number of the portal you want to add.' and 'To change the default settings of the discovery of the target portal, click the Advanced button.' Below this, there are two input fields: 'IP address or DNS name:' with the value '172.16.10.20' and 'Port: (Default is 3260.)' with the value '3260'. At the bottom, there are three buttons: 'Advanced...', 'OK', and 'Cancel'.

7. Select Microsoft iSCSI Initiator as the Local adapter, select the Initiator IP in the same subnet as the IP address of the partner server from the previous step. Confirm the actions to complete the Target Portal discovery.

The screenshot shows the 'Advanced Settings' dialog box with the 'IPsec' tab selected. The 'General' tab is also visible. The 'Connect using' section has three dropdown menus: 'Local adapter' set to 'Microsoft iSCSI Initiator', 'Initiator IP' set to '172.16.10.1', and 'Target portal IP' is empty. The 'CRC / Checksum' section has two checkboxes: 'Data digest' and 'Header digest', both unchecked. The 'Enable CHAP log on' checkbox is also unchecked. The 'CHAP Log on information' section contains a text box for 'Name' with the value 'iqn.1991-05.com.microsoft:sw01' and an empty 'Target secret' text box. Below this, there are three more checkboxes: 'Perform mutual authentication' (unchecked), 'Use RADIUS to generate user authentication credentials' (unchecked), and 'Use RADIUS to authenticate target credentials' (unchecked). The dialog box has 'OK', 'Cancel', and 'Apply' buttons at the bottom right.

8. Now, all the target portals are added on the first node.

9. Repeat the steps 1-8 on the partner node.

Connecting Targets

1. Click the Targets tab. The previously created targets are listed in the Discovered Targets section.

NOTE: If the created targets are not listed, check the firewall settings of the StarWind Server as well as the list of networks served by the StarWind Server (go to StarWind

Management Console -> Configuration -> Network). Alternatively, check the Access Rights tab on the corresponding StarWind VSAN server in StarWind Management Console for any restrictions.

2. Select the Witness target from the local server and click Connect.
3. Enable checkboxes as shown in the image below. Click Advanced.

4. Select Microsoft iSCSI Initiator in the Local adapter dropdown menu. In the Initiator IP field, select the IP address for the iSCSI channel. In the Target portal IP, select the corresponding portal IP from the same subnet. Confirm the actions.

The screenshot shows the 'Advanced Settings' dialog box with the 'IPsec' tab selected. The 'Connect using' section has three dropdown menus: 'Local adapter' set to 'Microsoft iSCSI Initiator', 'Initiator IP' set to '172.16.10.1', and 'Target portal IP' set to '172.16.10.10 / 3260'. The 'CRC / Checksum' section has two unchecked checkboxes: 'Data digest' and 'Header digest'. The 'Enable CHAP log on' checkbox is also unchecked. The 'CHAP Log on information' section contains a text box for 'Name' with the value 'iqn.1991-05.com.microsoft:sw01' and an empty 'Target secret' text box. Below this, there are three more unchecked checkboxes: 'Perform mutual authentication', 'Use RADIUS to generate user authentication credentials', and 'Use RADIUS to authenticate target credentials'. At the bottom right are 'OK', 'Cancel', and 'Apply' buttons.

5. Repeat the steps 2-4 to connect to partner node.
6. Select the CSV1 target discovered from the local server and click Connect.
7. Enable checkboxes as shown in the image below. Click Advanced.

8. Select Microsoft iSCSI Initiator in the Local adapter dropdown menu. In Target portal IP, select 172.16.10.10. Confirm the actions.

9. Select the partner target from the other StarWind node and click Connect.

10. Repeat the step 6.

11. Select Microsoft iSCSI Initiator in the Local adapter dropdown menu. In the Initiator IP field, select the IP address for the iSCSI channel. In the Target portal IP, select the corresponding portal IP from the same subnet. Confirm the actions.

The screenshot shows the 'Advanced Settings' dialog box with the 'IPsec' tab selected. The 'Connect using' section has three dropdown menus: 'Local adapter' set to 'Microsoft iSCSI Initiator', 'Initiator IP' set to '172.16.10.1', and 'Target portal IP' set to '172.16.10.20 / 3260'. The 'CRC / Checksum' section has two unchecked checkboxes: 'Data digest' and 'Header digest'. The 'Enable CHAP log on' checkbox is also unchecked. The 'CHAP Log on information' section contains a text box for 'Name' with the value 'iqn.1991-05.com.microsoft:sw01' and an empty 'Target secret' text box. Below this, there are three more unchecked checkboxes: 'Perform mutual authentication', 'Use RADIUS to generate user authentication credentials', and 'Use RADIUS to authenticate target credentials'. At the bottom right are 'OK', 'Cancel', and 'Apply' buttons.

11. Repeat the steps 1-10 for all remaining HA device targets.

12. Repeat the steps 1-11 on the other StarWind node, specifying corresponding data channel IP addresses.

Configuring Multipath

NOTE: It is recommended to configure the different MPIO policies depending on iSCSI channel throughput. For 1 Gbps iSCSI channel throughput, it is recommended to set Failover Only or Least Queue Depth MPIO load balancing policy. For 10 Gbps iSCSI channel throughput, it is recommended to set Round Robin or Least Queue Depth MPIO

load balancing policy.

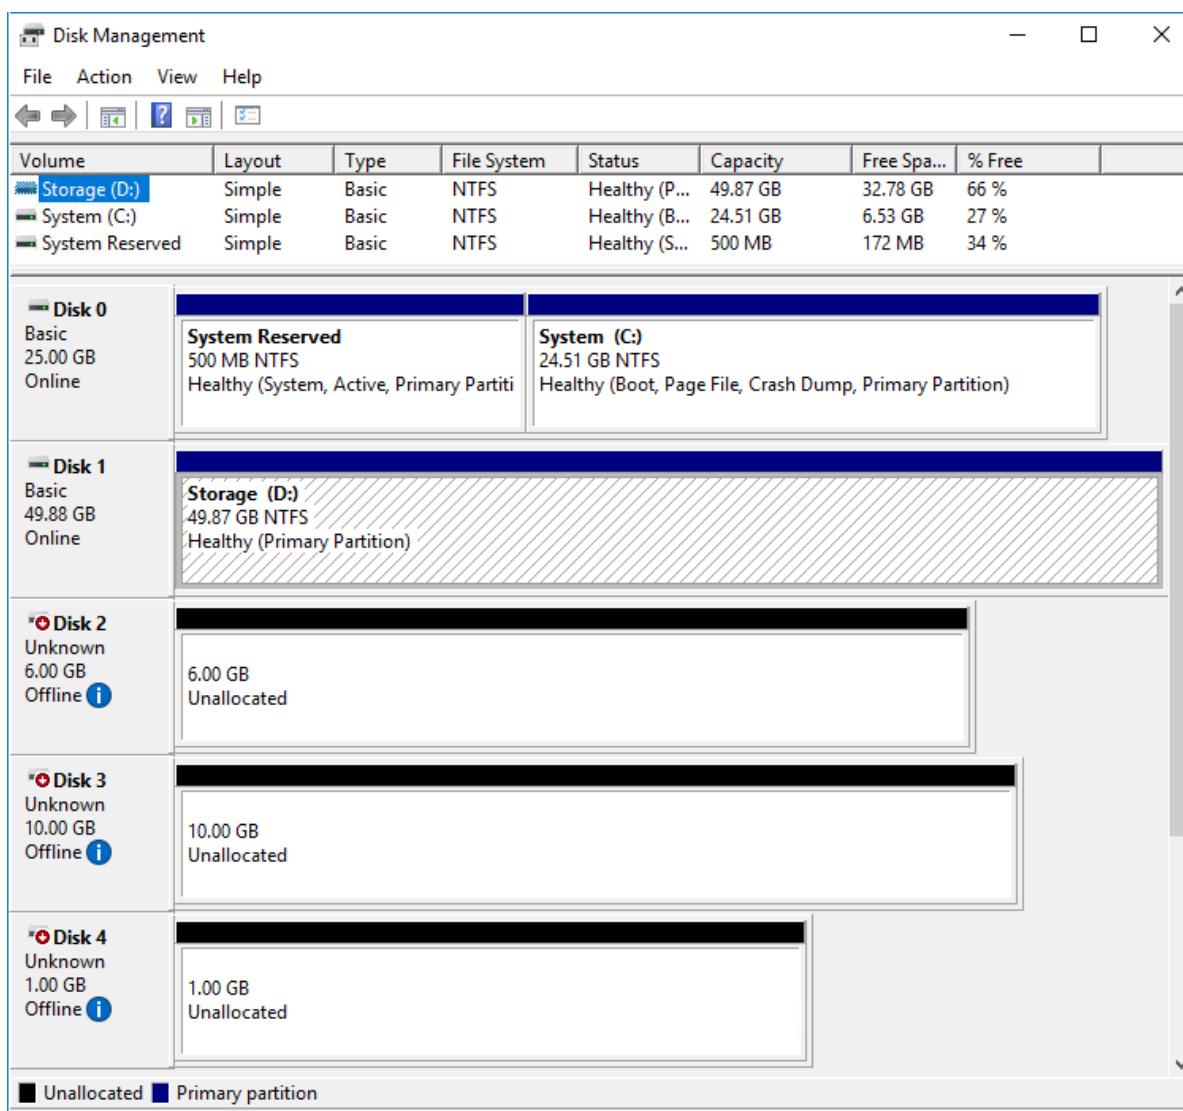

1. Configure the MPIO policy for each target with the load balance policy of choice. Select the Target located on the local server and click Devices.
2. In the Devices dialog, click MPIO.

3. Select the appropriate load balancing policy.
4. Repeat the steps 1-3 for configuring the MPIO policy for each remaining device on the current node and on the partner node.

Connecting Disks to Servers

1. Open the Disk Management snap-in. The StarWind disks will appear as unallocated and offline.

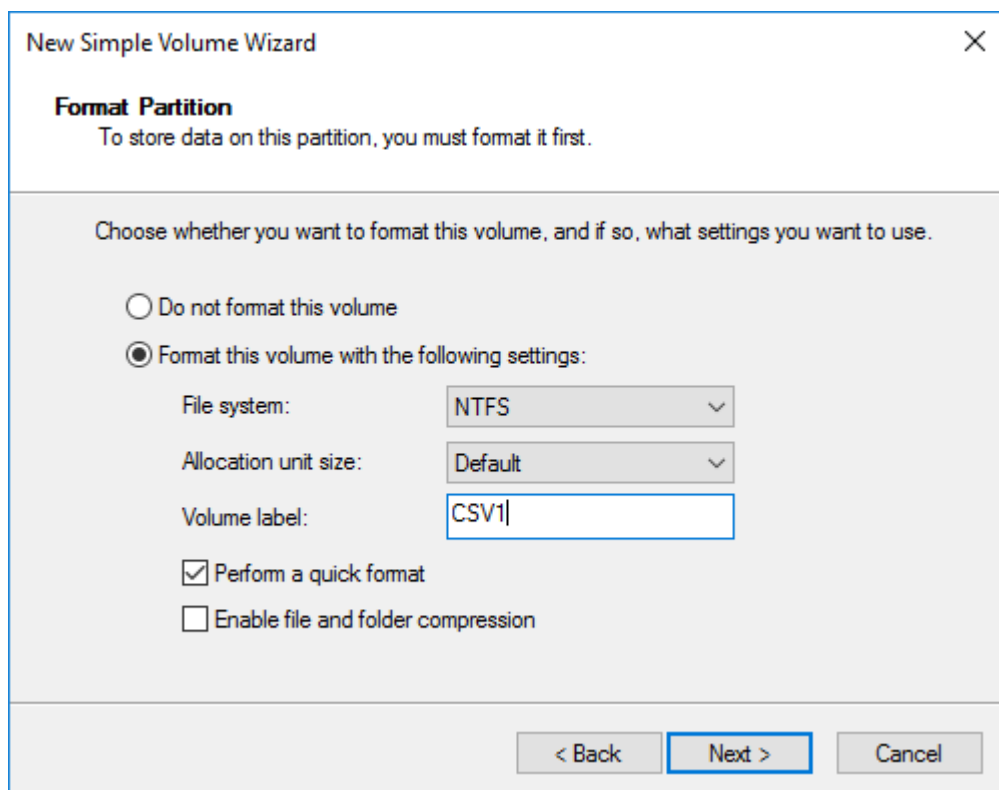

2. Bring the disks online by right-clicking on them and selecting the Online menu option.
3. Select the CSV disk (check the disk size to be sure) and right-click on it to initialize.
4. By default, the system will offer to initialize all non-initialized disks. Use the Select Disks area to choose the disks. Select GPT (GUID Partition Style) for the partition style to be applied to the disks. Press OK to confirm.

5. Right-click on the selected disk and choose New Simple Volume.
6. In New Simple Volume Wizard, indicate the volume size. Click Next.
7. Assign a drive letter to the disk. Click Next.

8. Select NTFS in the File System dropdown menu. Keep Allocation unit size as Default. Set the Volume Label of choice. Click Next.

New Simple Volume Wizard [X]

Format Partition
To store data on this partition, you must format it first.

Choose whether you want to format this volume, and if so, what settings you want to use.

☐ Do not format this volume

☒ Format this volume with the following settings:

File system: NTFS

Allocation unit size: Default

Volume label: CSV1

☒ Perform a quick format

☐ Enable file and folder compression

< Back **Next >** Cancel

9. Press Finish to complete.

10. Complete the steps 1-9 for the Witness disk. Do not assign any drive letter or drive path for it.

11. On the partner node, open the Disk Management snap-in. All StarWind disks will appear offline. If the status is different from the one shown below, click Action->Refresh in the top menu to update the information about the disks.

12. Repeat step 2 to bring all the remaining StarWind disks online.

Creating A Failover Cluster In Windows Server

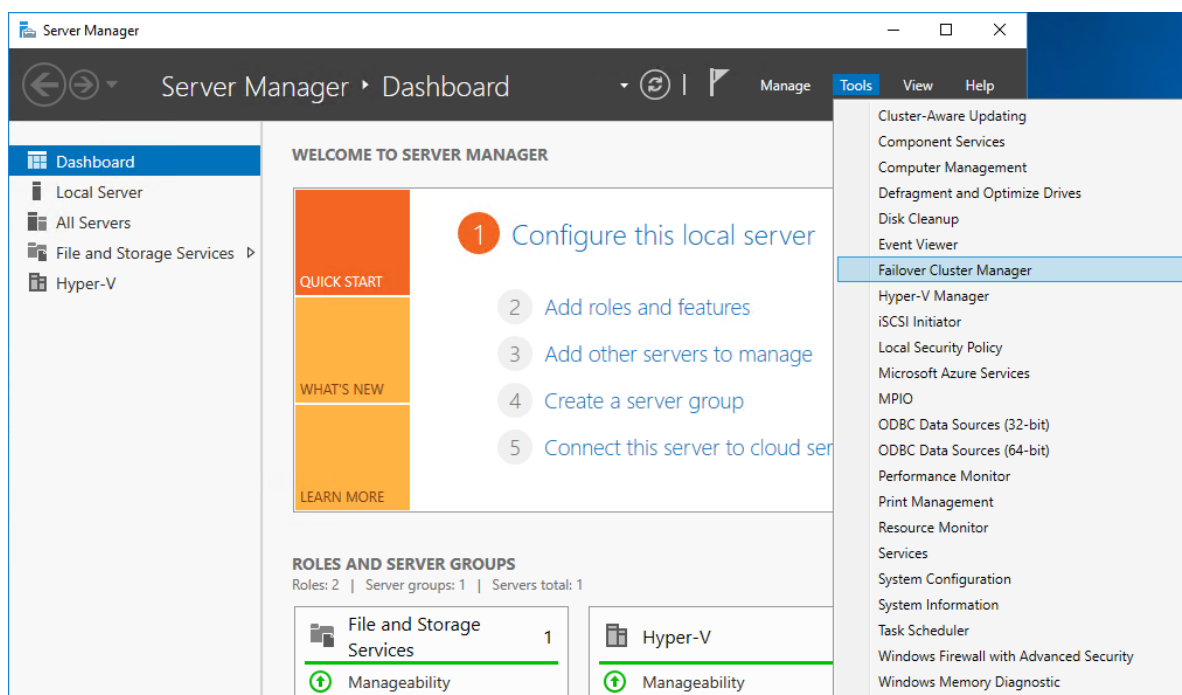

NOTE: To avoid issues during the cluster validation configuration, it is recommended to install the latest Microsoft updates on each node.

NOTE: Server Manager can be opened on the server with desktop experience enabled (necessary features should be installed). Alternatively, the Failover cluster can be managed with Remote Server Administration Tools:

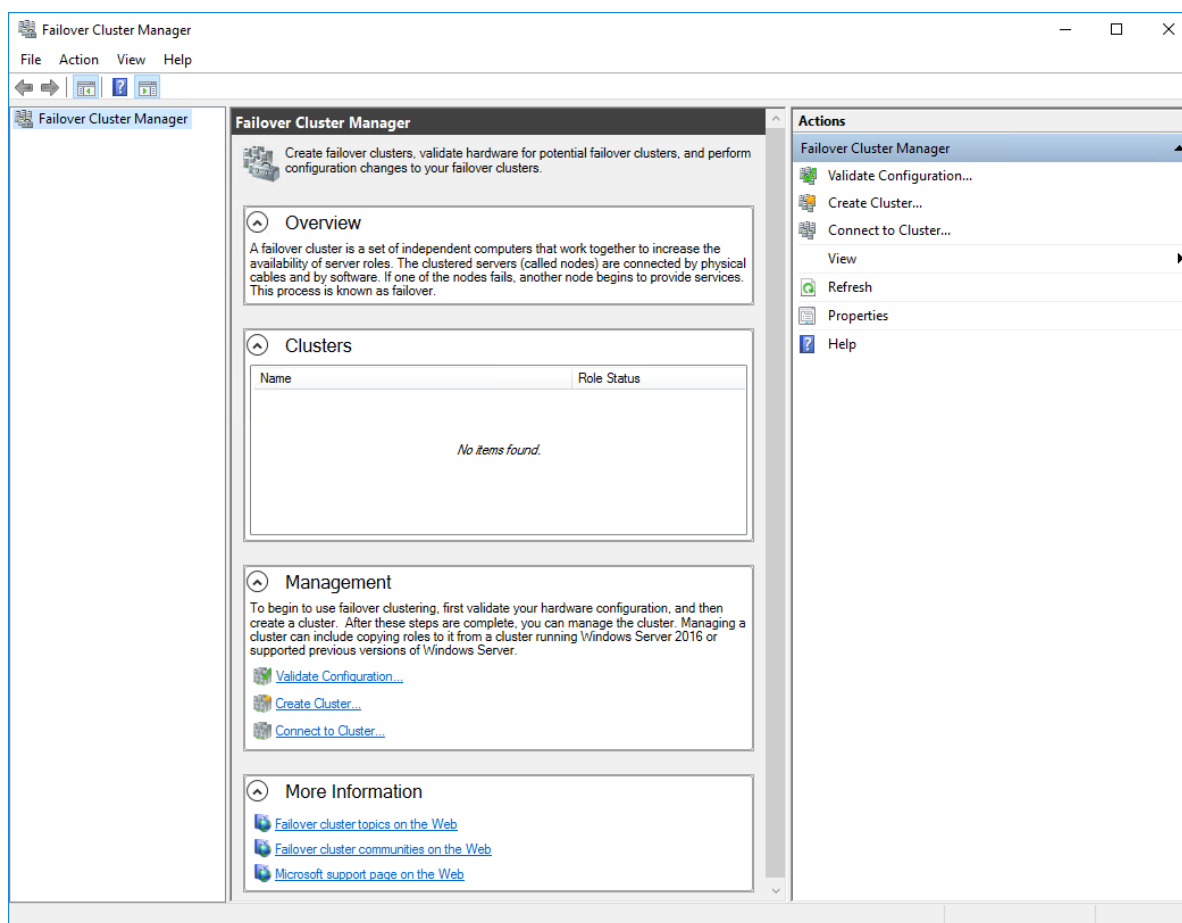

<https://docs.microsoft.com/en-us/windows-server/remote/remote-server-administration-tools>

NOTE: For converged deployment (SAN & NAS running as a dedicated storage cluster) the Microsoft Failover Cluster is deployed on separate computing nodes. Additionally, for the converged deployment scenario, the storage nodes that host StarWind SAN & NAS as CVM or bare metal do not require a domain controller and Failover Cluster to operate.

1. Open Server Manager. Select the Failover Cluster Manager item from the Tools menu.

2. Click the Create Cluster link in the Actions section of Failover Cluster Manager.

3. Specify the servers to be added to the cluster. Click Next to continue.

Create Cluster Wizard

Select Servers

Before You Begin
Select Servers
 Validation Warning
 Access Point for Administering the Cluster
 Confirmation
 Creating New Cluster
 Summary

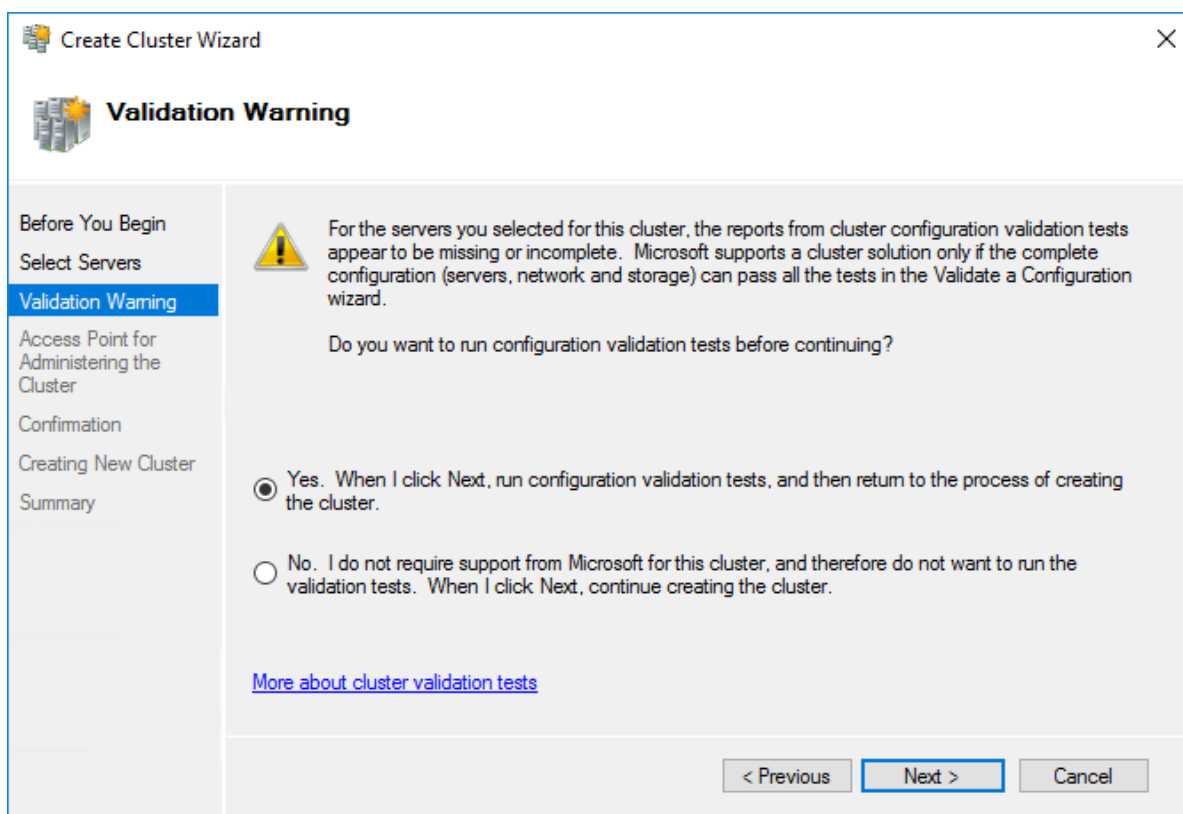

Add the names of all the servers that you want to have in the cluster. You must add at least one server.

Enter server name:

Selected servers:

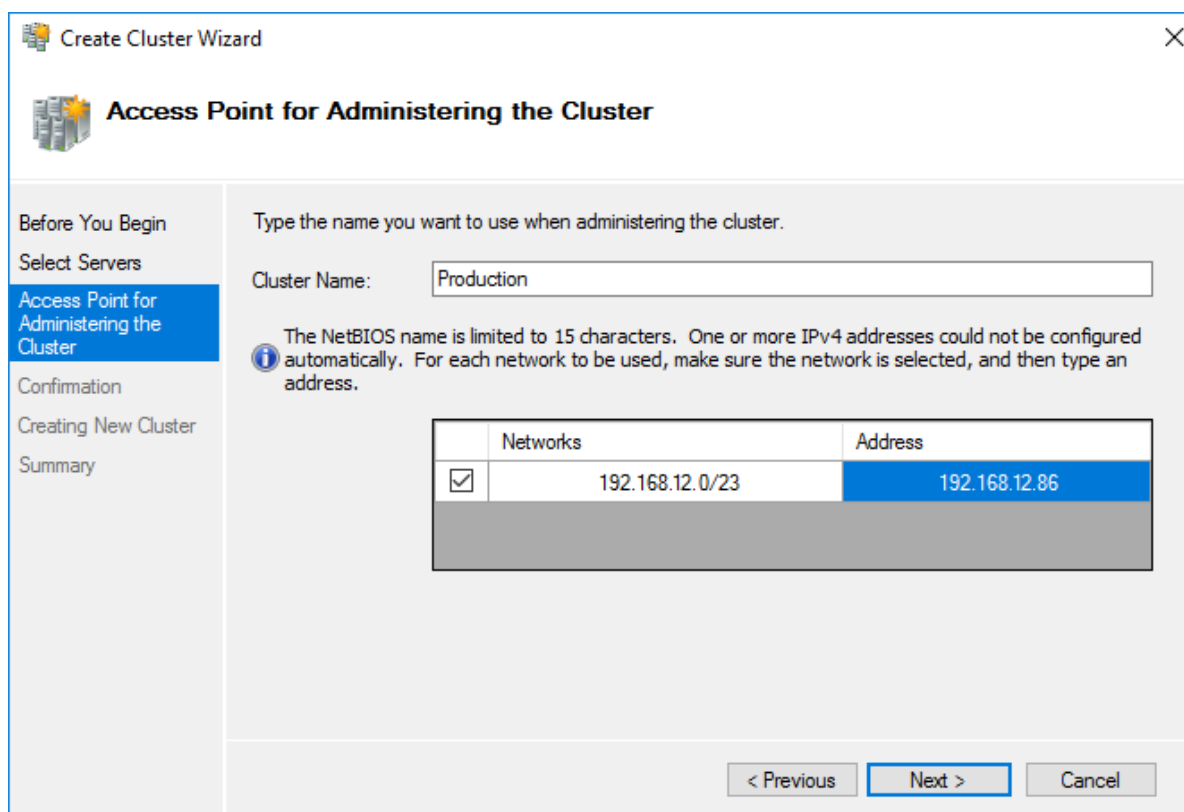

- SW1.starwind.local
- SW2.starwind.local

4. Validate the configuration by running the cluster validation tests: select Yes... and click Next to continue.

5. Specify the cluster name.

NOTE: If the cluster servers get IP addresses over DHCP, the cluster also gets its IP address over DHCP. If the IP addresses are set statically, set the cluster IP address manually.

Create Cluster Wizard

Access Point for Administering the Cluster

Before You Begin
Select Servers
Access Point for Administering the Cluster
Confirmation
Creating New Cluster
Summary

Type the name you want to use when administering the cluster.

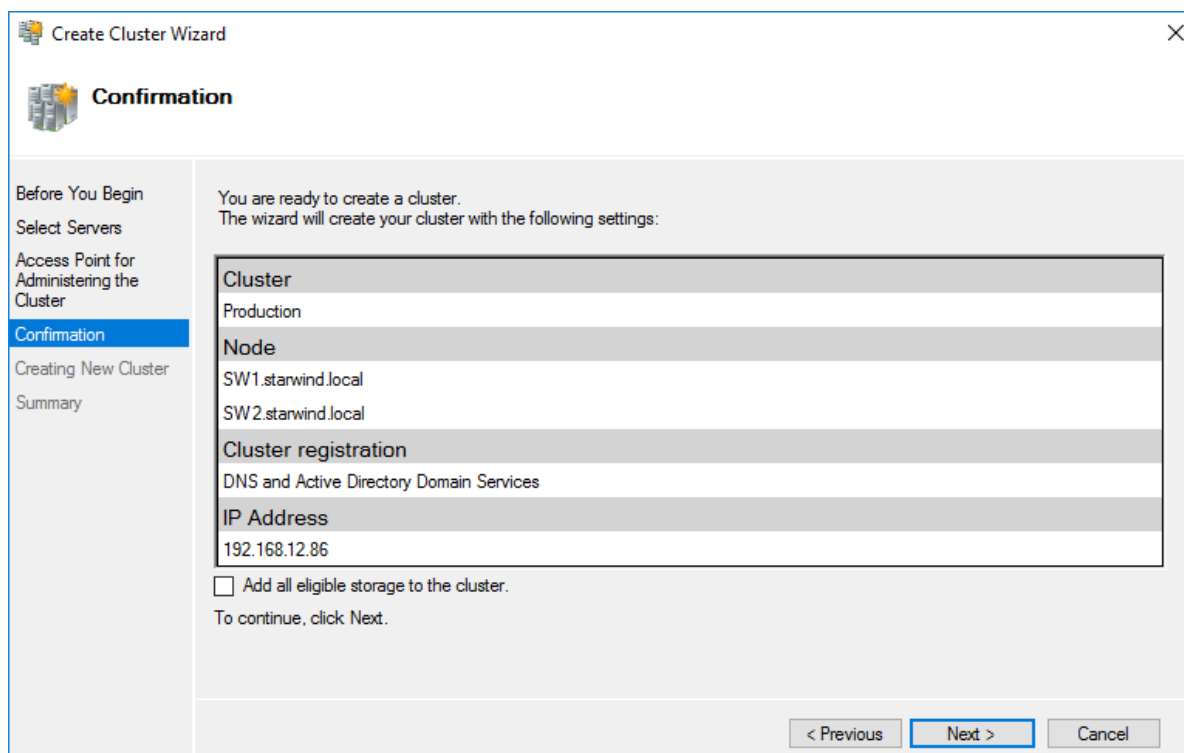

Cluster Name:

i The NetBIOS name is limited to 15 characters. One or more IPv4 addresses could not be configured automatically. For each network to be used, make sure the network is selected, and then type an address.

	Networks	Address
<input checked="" type="checkbox"/>	192.168.12.0/23	192.168.12.86

< Previous **Next >** Cancel

6. Make sure that all settings are correct. Click Previous to make any changes or Next to proceed.

Create Cluster Wizard

Confirmation

Before You Begin
Select Servers
Access Point for Administering the Cluster
Confirmation
Creating New Cluster
Summary

You are ready to create a cluster.
The wizard will create your cluster with the following settings:

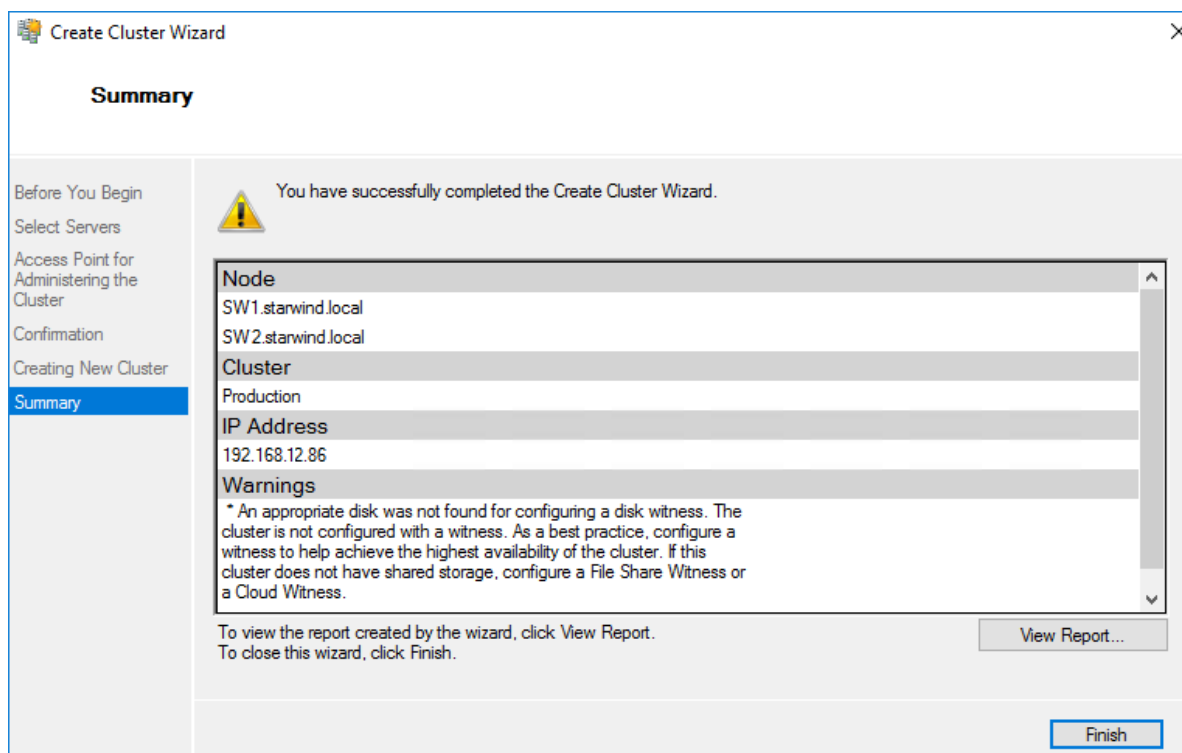

Cluster	Production
Node	SW1.starwind.local SW2.starwind.local
Cluster registration	DNS and Active Directory Domain Services
IP Address	192.168.12.86

☐ Add all eligible storage to the cluster.
To continue, click Next.

< Previous **Next >** Cancel

NOTE: If checkbox Add all eligible storage to the cluster is selected, the wizard will add all disks to the cluster automatically. The device with the smallest storage volume will be assigned as a Witness. It is recommended to uncheck this option before clicking Next and add cluster disks and the Witness drive manually.

7. The process of the cluster creation starts. Upon the completion, the system displays the summary with the detailed information. Click Finish to close the wizard.

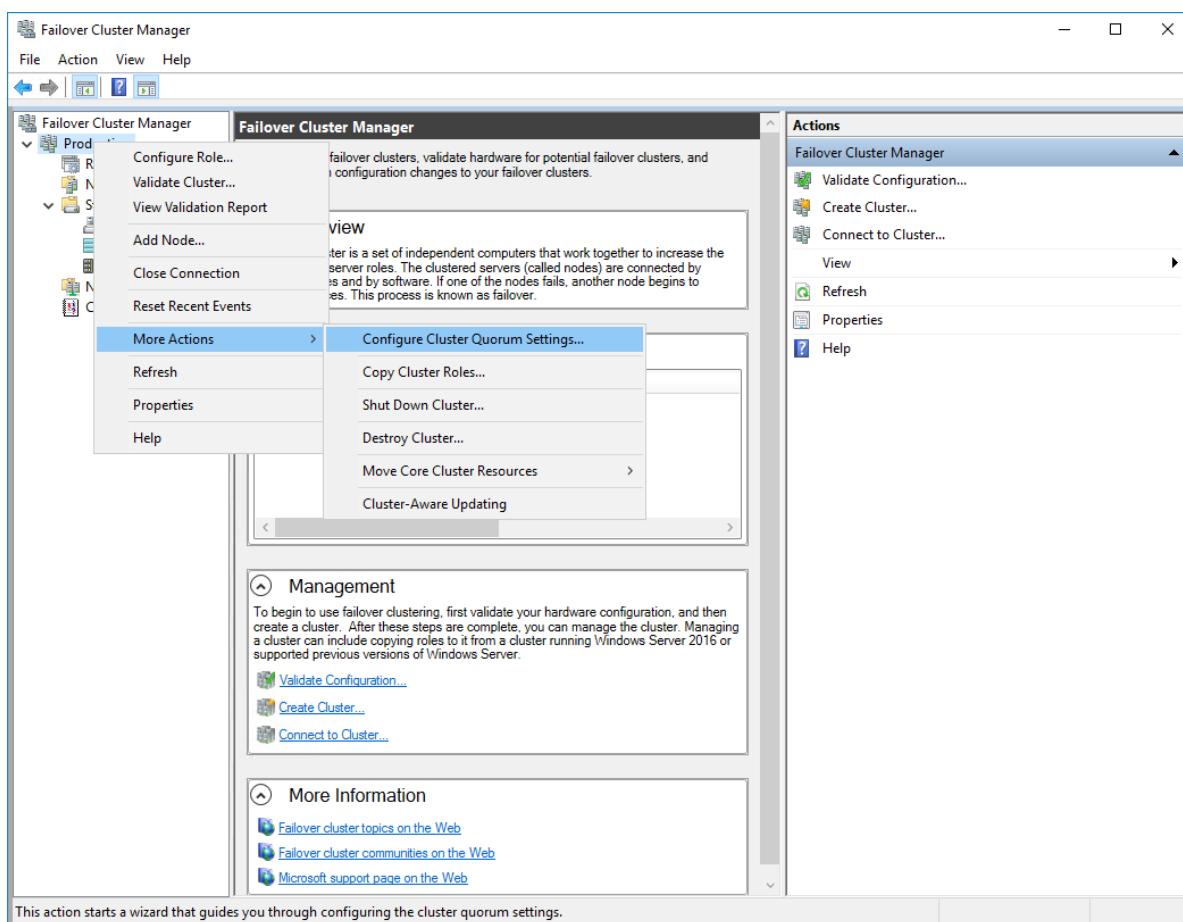

Adding Storage to the Cluster

1. In Failover Cluster Manager, navigate to Cluster -> Storage -> Disks. Click Add Disk in the Actions panel, choose StarWind disks from the list and confirm the selection.

2. To configure the cluster witness disk, right-click on Cluster and proceed to More Actions -> Configure Cluster Quorum Settings.

3. Follow the wizard and use the Select the quorum witness option. Click Next.

4. Select Configure a disk witness. Click Next.

5. Select the Witness disk to be assigned as the cluster witness disk. Click Next and press Finish to complete the operation.

6. In Failover Cluster Manager, Right-click the disk and select Add to Cluster Shared Volumes.

7. If renaming of the cluster shared volume is required, right-click on the disk and select Properties. Type the new name for the disk and click Apply followed by OK.

8. Perform the steps 6-7 for any other disk in Failover Cluster Manager. The resulting list of disks will look similar to the screenshot below.

Configuring Cluster Network Preferences

1. In the Networks section of the Failover Cluster Manager, right-click on the network from the list. Set its new name if required to identify the network by its subnet. Apply the change and press OK.

NOTE: Please double-check that cluster communication is configured with redundant networks:

<https://docs.microsoft.com/en-us/windows-server/failover-clustering/smb-multichannel>

2. Rename other networks as described above, if required.

3. In the Actions tab, click Live Migration Settings. Uncheck the synchronization network, while the iSCSI network can be used if it is 10+ Gbps. Apply the changes and click OK.

The cluster configuration is completed and it is ready for virtual machines deployment. Select Roles and in the Action tab, click Virtual Machines -> New Virtual Machine. Complete the wizard.

Configuring File Shares

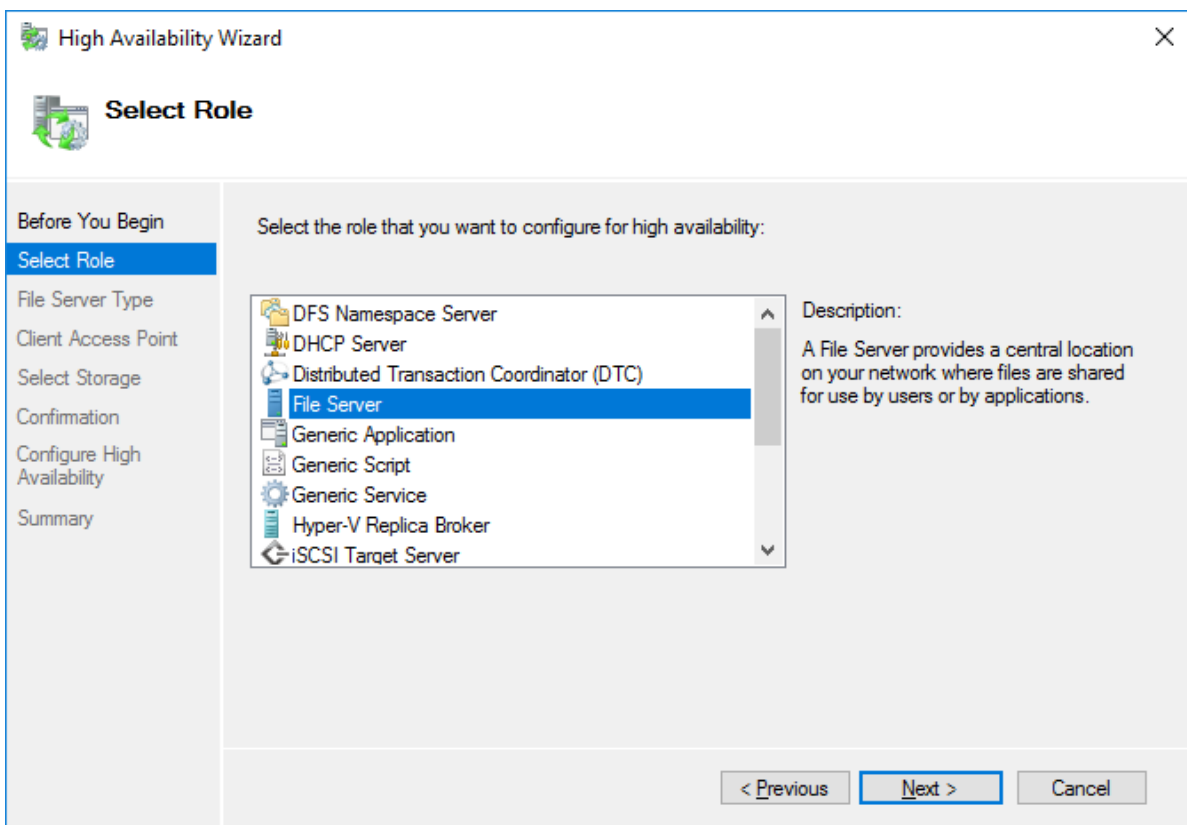

Please follow the steps below if file shares should be configured on cluster nodes.

Configuring The Scale-Out File Server Role

1. To configure the Scale-Out File Server Role, open Failover Cluster Manager.
2. Right-click the cluster name, then click Configure Role and click Next to continue.

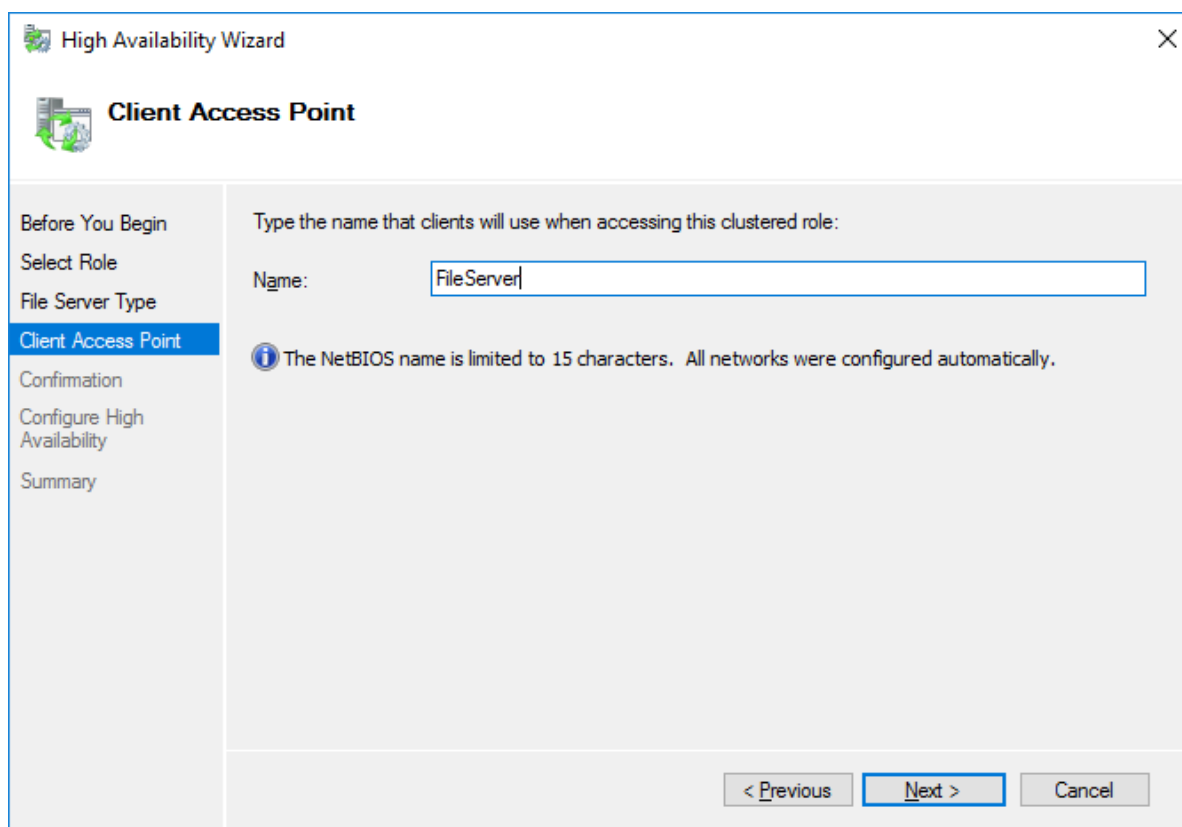

3. Select the File Server item from the list in High Availability Wizard and click Next to continue.

4. Select Scale-Out File Server for application data and click Next.

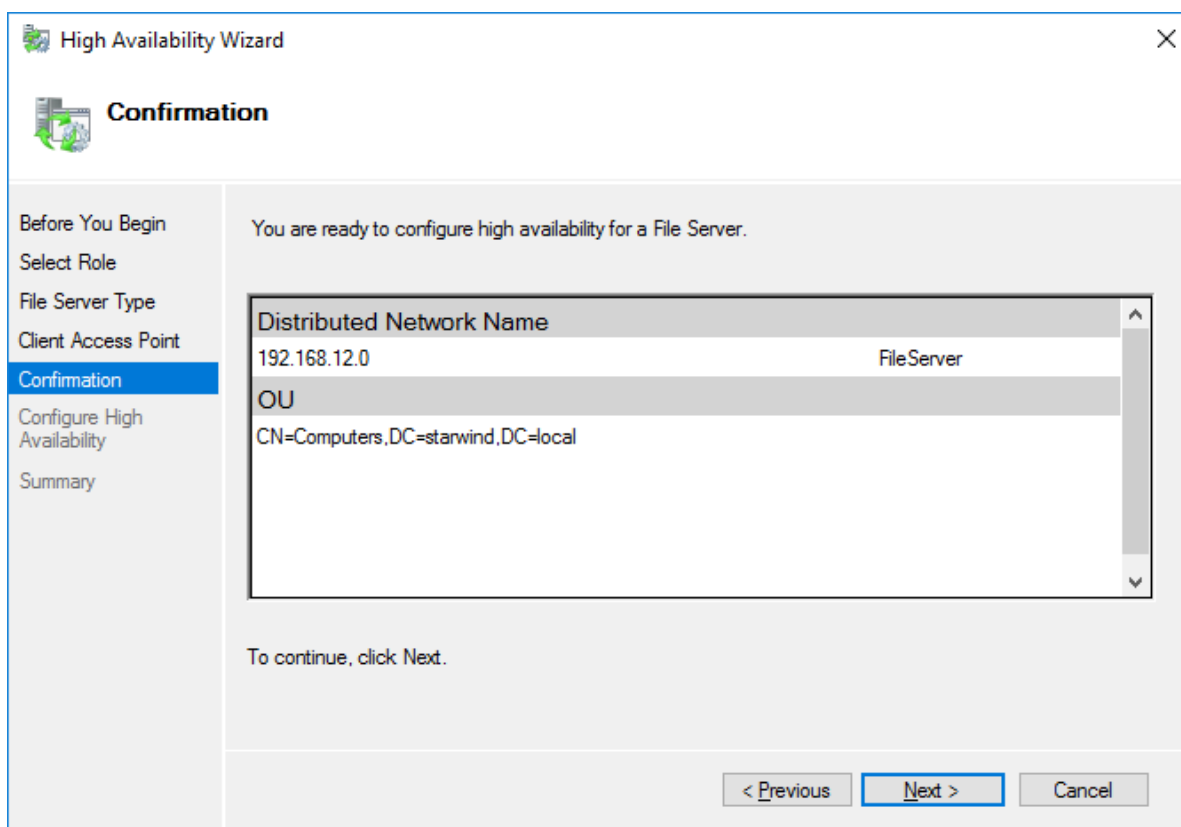

5. On the Client Access Point page, in the Name text field, type the NetBIOS name that will be used to access a Scale-Out File Server.

The image shows a screenshot of the 'High Availability Wizard' window, specifically the 'Client Access Point' step. The window has a title bar with the text 'High Availability Wizard' and a close button. Below the title bar, there is a section with a server icon and the text 'Client Access Point'. On the left side, there is a vertical list of steps: 'Before You Begin', 'Select Role', 'File Server Type', 'Client Access Point' (which is highlighted with a blue background), 'Confirmation', 'Configure High Availability', and 'Summary'. The main area of the wizard contains the text 'Type the name that clients will use when accessing this clustered role:' followed by a text input field with the value 'FileServer'. Below the input field, there is an information icon and a message: 'The NetBIOS name is limited to 15 characters. All networks were configured automatically.' At the bottom right of the wizard, there are three buttons: '< Previous', 'Next >' (which is highlighted with a blue border), and 'Cancel'.

Click Next to continue.

6. Check whether the specified information is correct. Click Next to continue or Previous to change the settings.

7. Once the installation is finished successfully, the Wizard should now look like the screenshot below.
Click Finish to close the Wizard.

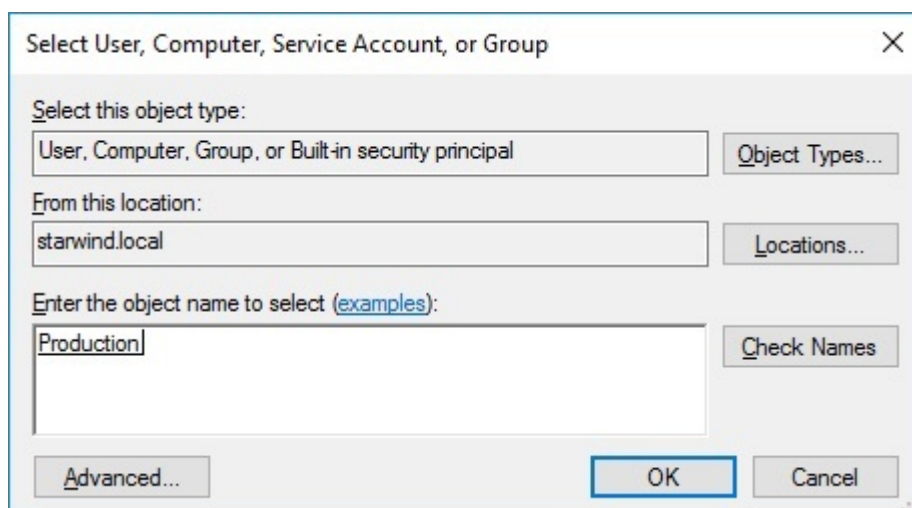

8. The newly created role should now look like the screenshot below.

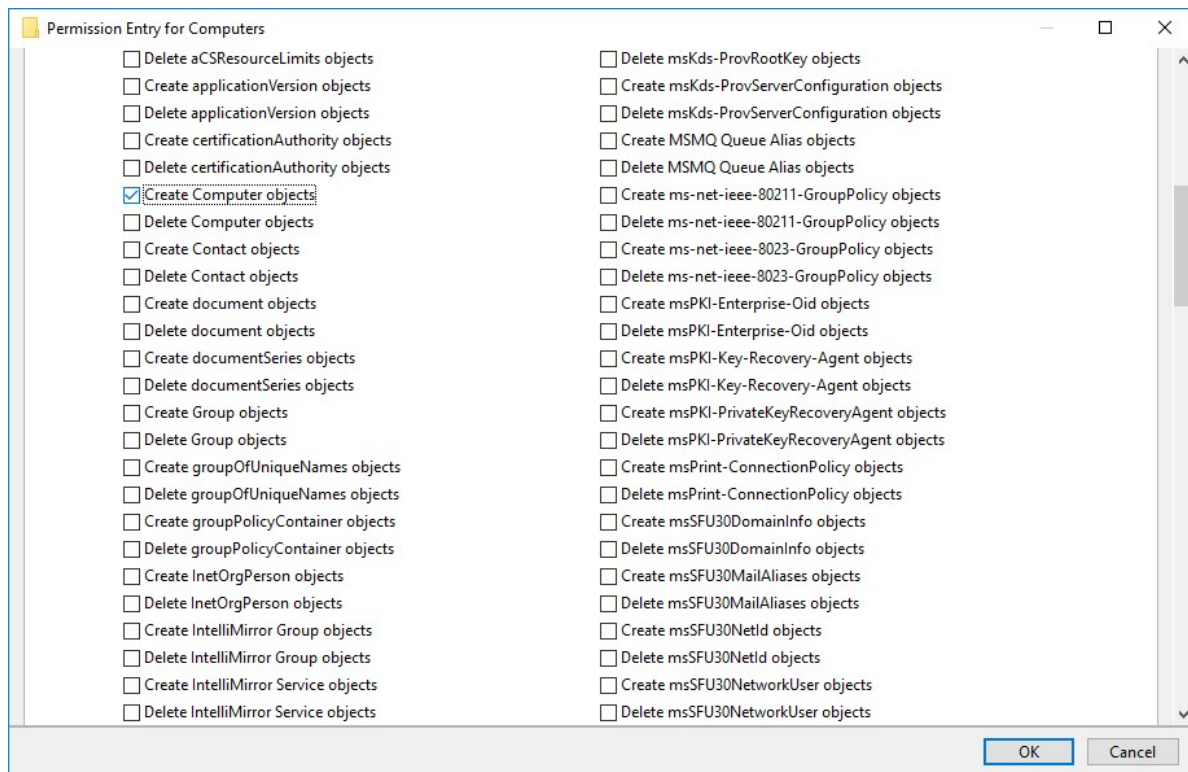

NOTE: If the role status is Failed and it is unable to Start, please, follow the next steps:

- open Active Directory Users and Computers
- enable the Advanced view if it is not enabled
- edit the properties of the OU containing the cluster computer object (in this case – Production)
- open the Security tab and click Advanced
- in the appeared window, press Add (the Permission Entry dialog box opens), click Select a principal
- in the appeared window, click Object Types, select Computers, and click OK
- enter the name of the cluster computer object (in this case – Production)

- go back to Permission Entry dialog, scroll down, and select Create Computer Objects,

- click OK on all opened windows to confirm the changes
- open Failover Cluster Manager, right-click SOFS role and click Start Role

Configuring File Share

To Add File Share:

- open Failover Cluster Manager
- expand the cluster and then click Roles
- right-click the file server role and then press Add File Share
- on the Select the profile for this share page, click SMB Share – Applications and then click Next

5. Select a CSV to host the share. Click Next to proceed.

Select the server and path for this share

Server:

Server Name	Status	Cluster Role	Owner Node
FileServer	Online	Scale-Out File...	

Share location:

☒ Select by volume:

Volume	Free Space	Capacity	File System
C:\ClusterStorage\Volume1	5.92 GB	5.97 GB	CSVFS
C:\ClusterStorage\Volume2	9.91 GB	9.97 GB	CSVFS

The location of the file share will be a new folder in the \Shares directory on the selected volume.

☐ Type a custom path:

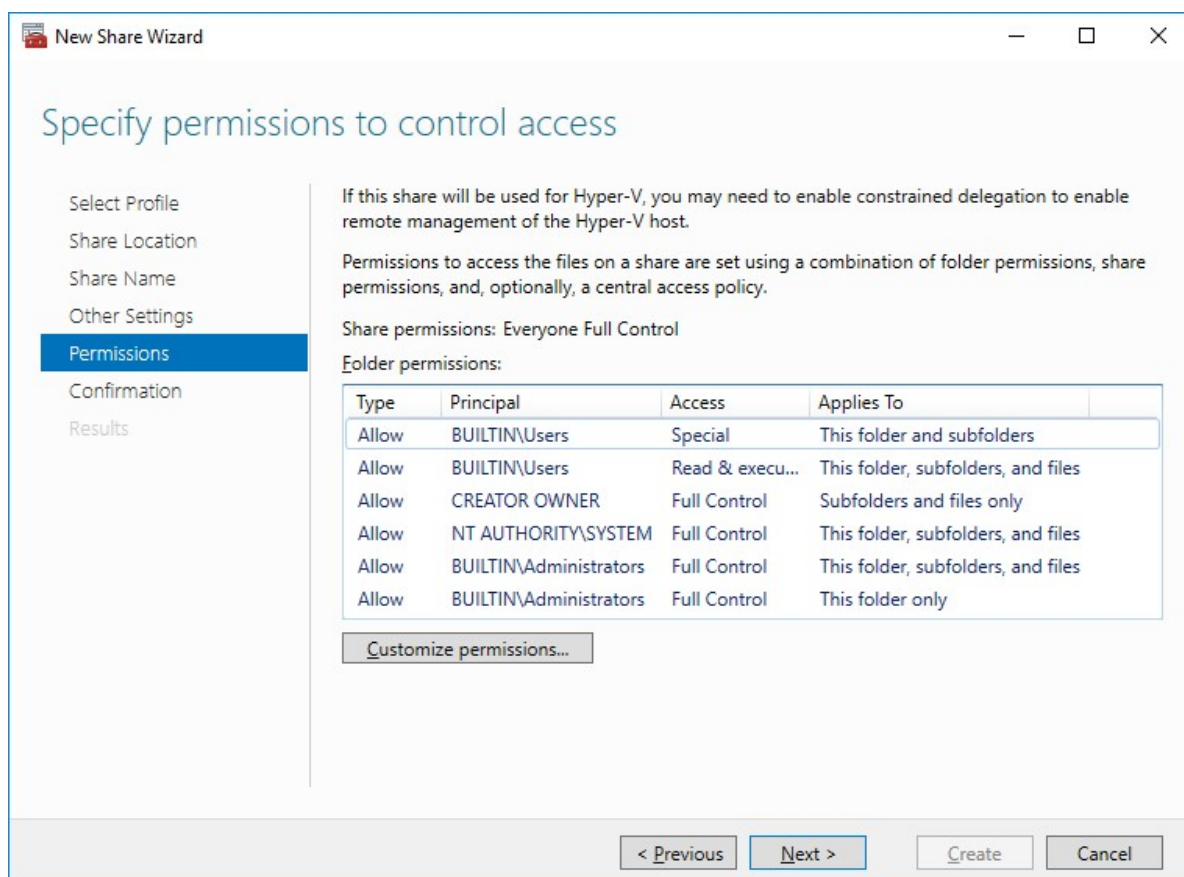

< Previous Next > Create Cancel

6. Type in the file share name and click Next.

7. Make sure that the Enable Continuous Availability box is checked. Click Next to proceed.

8. Specify the access permissions for the file share.

NOTE:

- for the Scale-Out File Server for Hyper-V, all Hyper-V computer accounts, the SYSTEM account, and all Hyper-V administrators must be provided with the full control on the share and file system
- for the Scale-Out File Server on Microsoft SQL Server, the SQL Server service account must be granted full control on the share and the file system

9. Check whether specified settings are correct. Click Previous to make any changes or click Create to proceed.

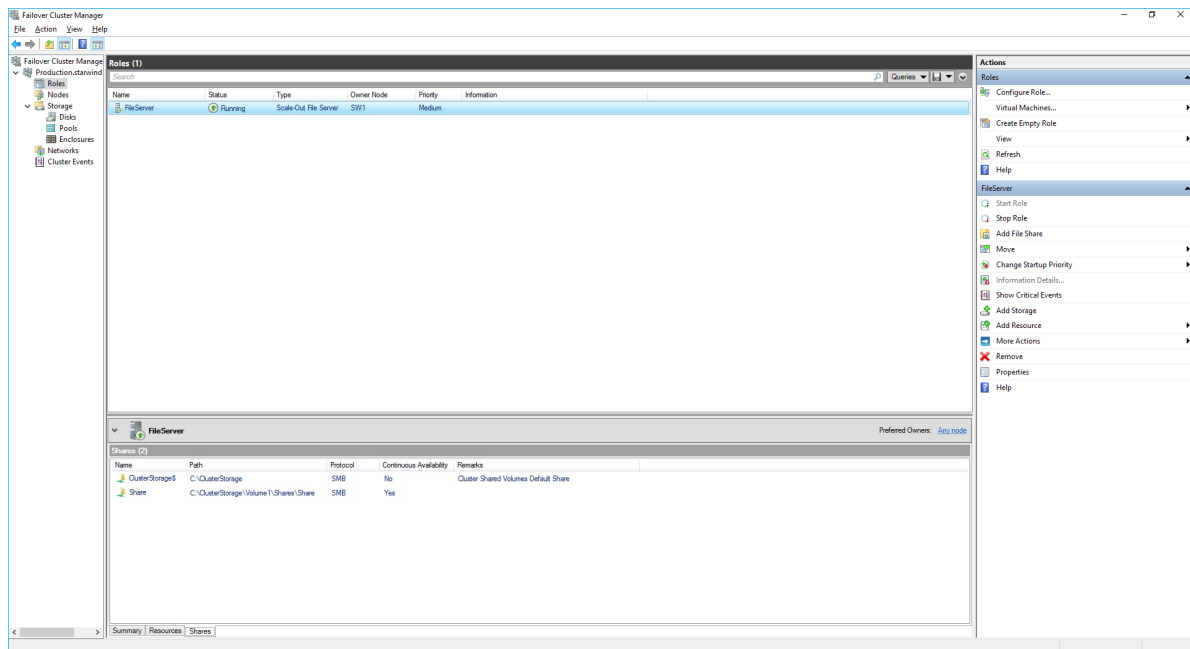

10. Check the summary and click Close to close the Wizard.

To Manage Created File Shares:

- open Failover Cluster Manager
- expand the cluster and click Roles
- choose the file share role, select the Shares tab, right-click the created file share, and select Properties:

Configuring The File Server For General Use Role

NOTE: To configure File Server for General Use, the cluster should have available storage

1. To configure the File Server for General Use role, open Failover Cluster Manager.
2. Right-click on the cluster name, then click Configure Role and click Next to continue.

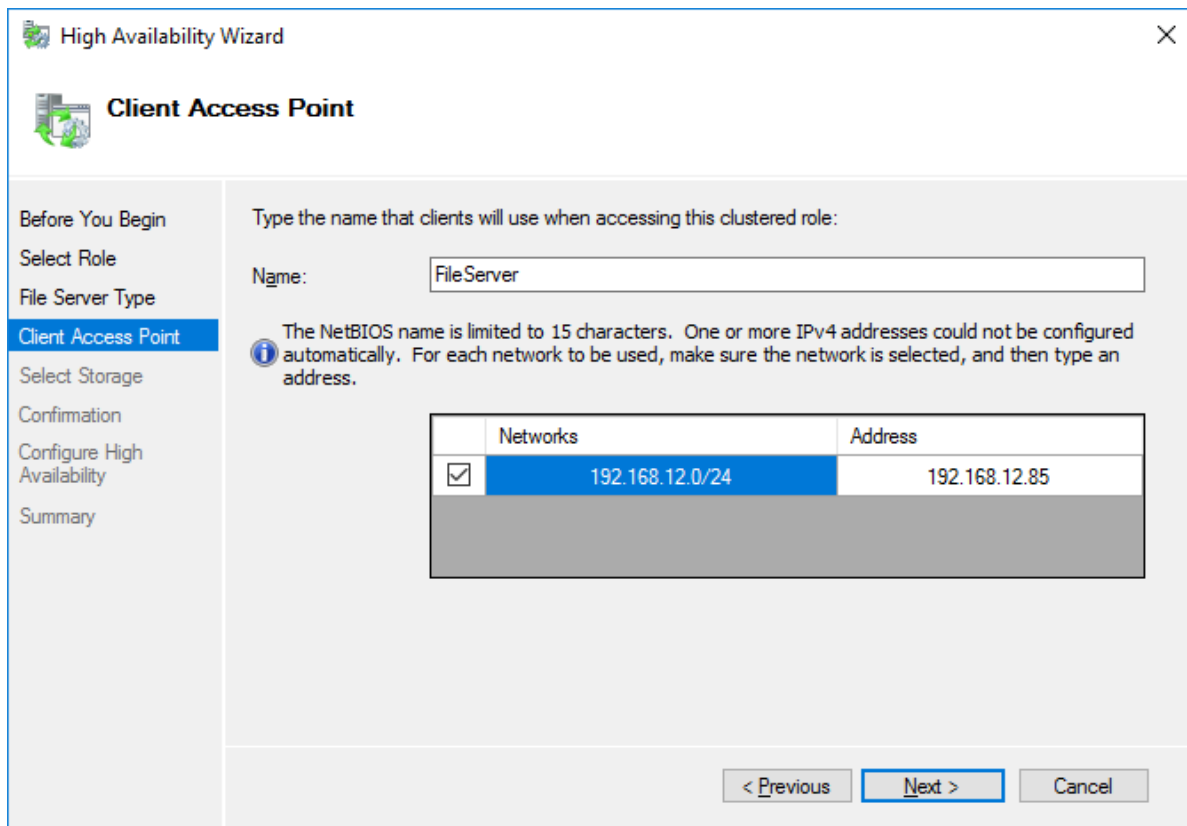

3. Select the File Server item from the list in High Availability Wizard and click Next to continue.

4. Select File Server for general use and click Next.

5. On the Client Access Point page, in the Name text field, type the NETBIOS name that will be used to access the File Server and IP for it.

The screenshot shows the 'High Availability Wizard' window, specifically the 'Client Access Point' step. On the left is a navigation pane with steps: 'Before You Begin', 'Select Role', 'File Server Type', 'Client Access Point' (highlighted), 'Select Storage', 'Confirmation', 'Configure High Availability', and 'Summary'. The main area is titled 'Client Access Point' and contains the instruction: 'Type the name that clients will use when accessing this clustered role:'. Below this is a text box labeled 'Name:' containing 'FileServer'. An information icon (i) is followed by a note: 'The NetBIOS name is limited to 15 characters. One or more IPv4 addresses could not be configured automatically. For each network to be used, make sure the network is selected, and then type an address.' Below the note is a table with two columns: 'Networks' and 'Address'. The first row shows a checked checkbox, the network '192.168.12.0/24', and the address '192.168.12.85'. At the bottom right are three buttons: '< Previous', 'Next >' (highlighted), and 'Cancel'.

Click Next to continue.

6. Select the Cluster disk and click Next.

7. Check whether the specified information is correct. Click Next to proceed or Previous to change the settings.

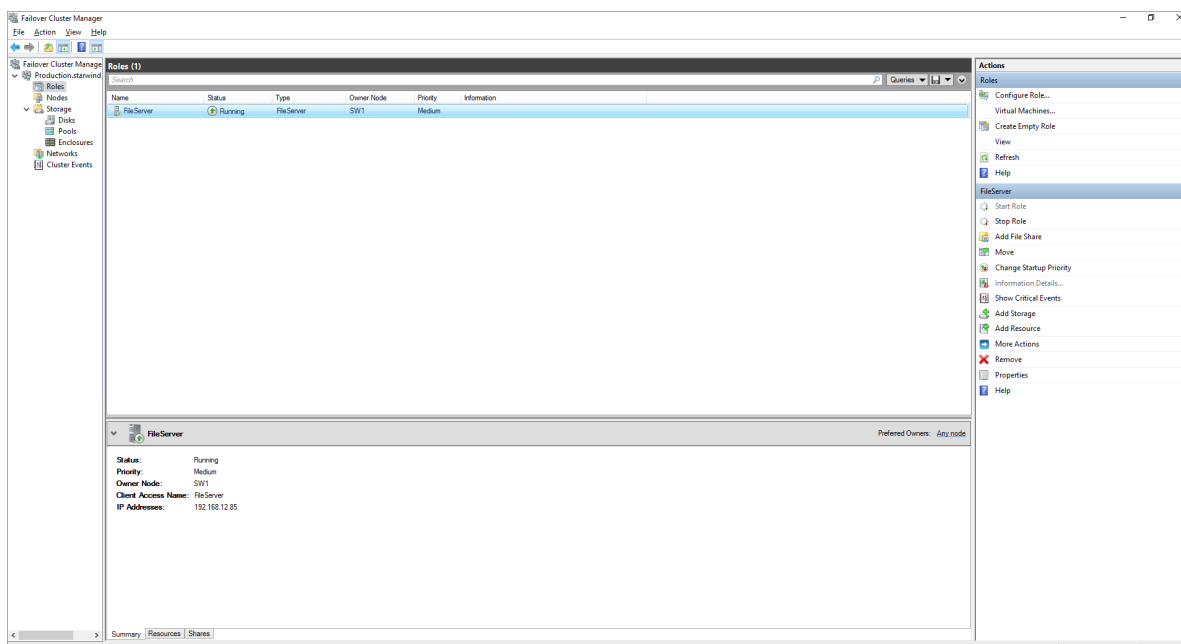

8. Once the installation has been finished successfully, the Wizard should now look like the screenshot below.

Click Finish to close the Wizard.

9. The newly created role should now look like the screenshot below.

NOTE: If the role status is Failed and it is unable to Start, please, follow the next steps:

- open Active Directory Users and Computers

- enable the Advanced view if it is not enabled
- edit the properties of the OU containing the cluster computer object (in this case – Production)
- open the Security tab and click Advanced
- in the appeared window, press Add (the Permission Entry dialog box opens), click Select a principal
- in the appeared window, click Object Types, select Computers, and click OK
- enter the name of the cluster computer object (in this case – Production)

- go back to Permission Entry dialog, scroll down, and select Create Computer Objects

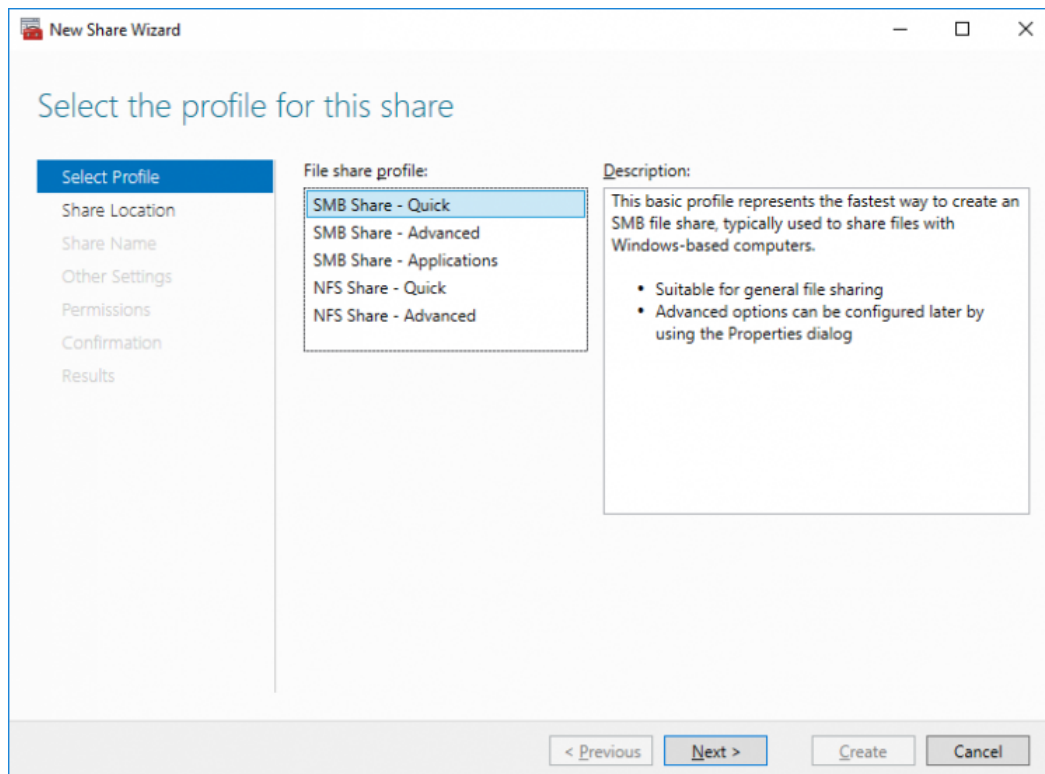

- click OK on all opened windows to confirm the changes

- open Failover Cluster Manager, right-click File Share role and click Start Role

Configuring Smb File Share

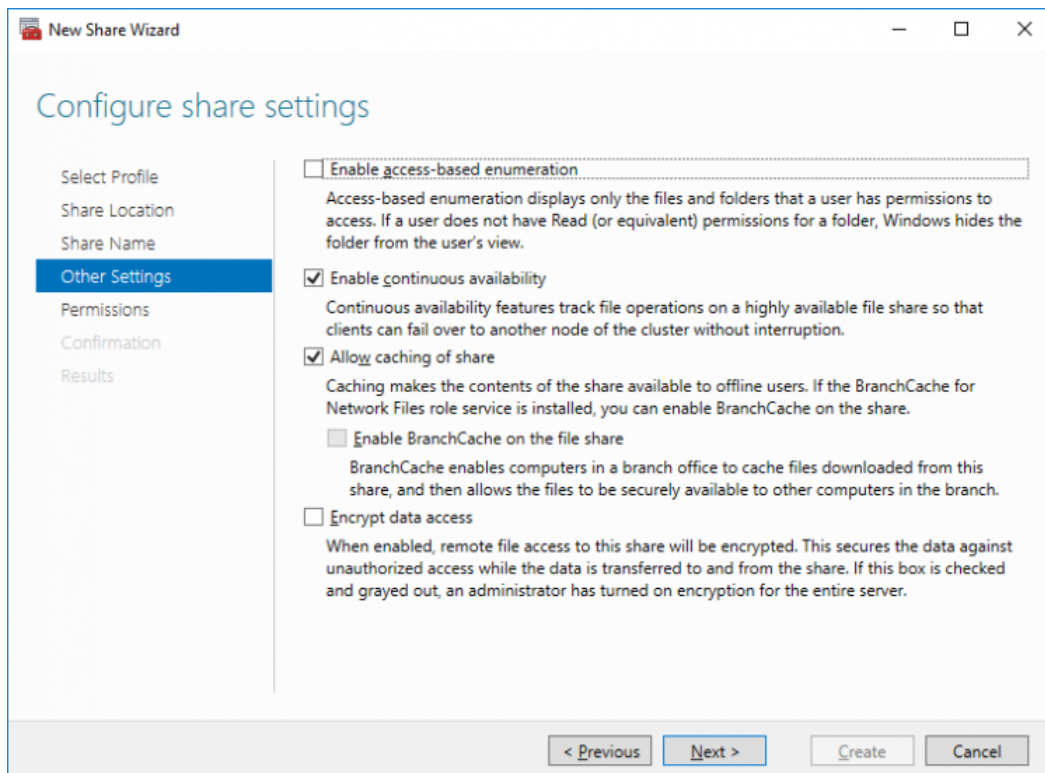

To Add SMB File Share

1. Open Failover Cluster Manager.
2. Expand the cluster and then click Roles.
3. Right-click the File Server role and then press Add File Share.
4. On the Select the profile for this share page, click SMB Share – Quick and then click Next.

5. Select available storage to host the share. Click Next to continue.

continue.

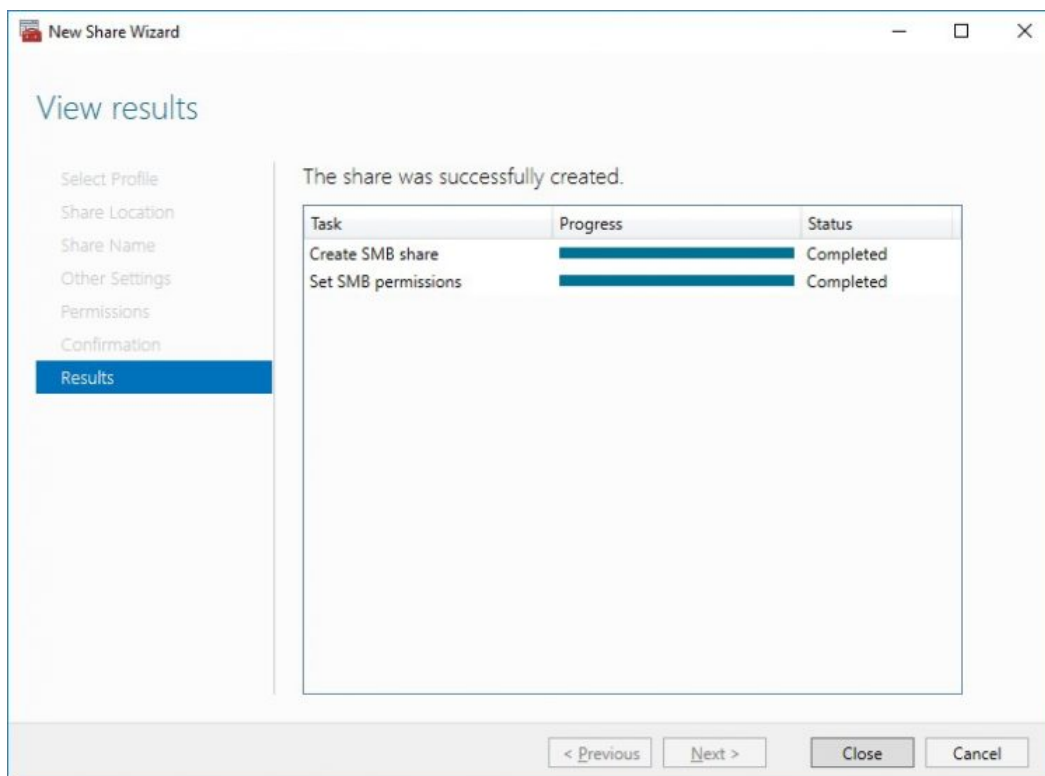

8.Specify the access permissions for the file share.

9. Check whether specified settings are correct. Click Previous to make any changes or Next/Create to continue.

10. Check the summary and click Close.

To manage created SMB File Shares

11. Open Failover Cluster Manager.

12. Expand the cluster and click Roles.

13. Choose the File Share role, select the Shares tab, right-click the created file share, and select Properties.

Configuring Nfs File Share

To Add NFS File Share

1. Open Failover Cluster Manager.
2. Expand the cluster and then click Roles.
3. Right-click the File Server role and then press Add File Share.
4. On the Select the profile for this share page, click NFS Share – Quick and then click Next.

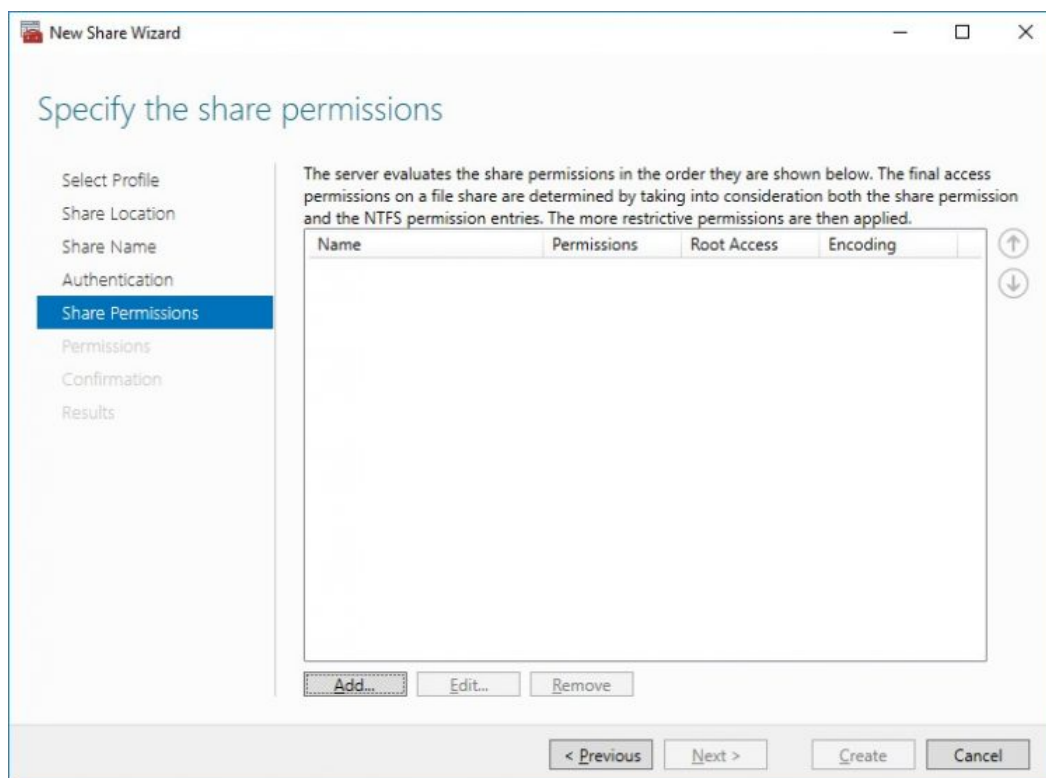

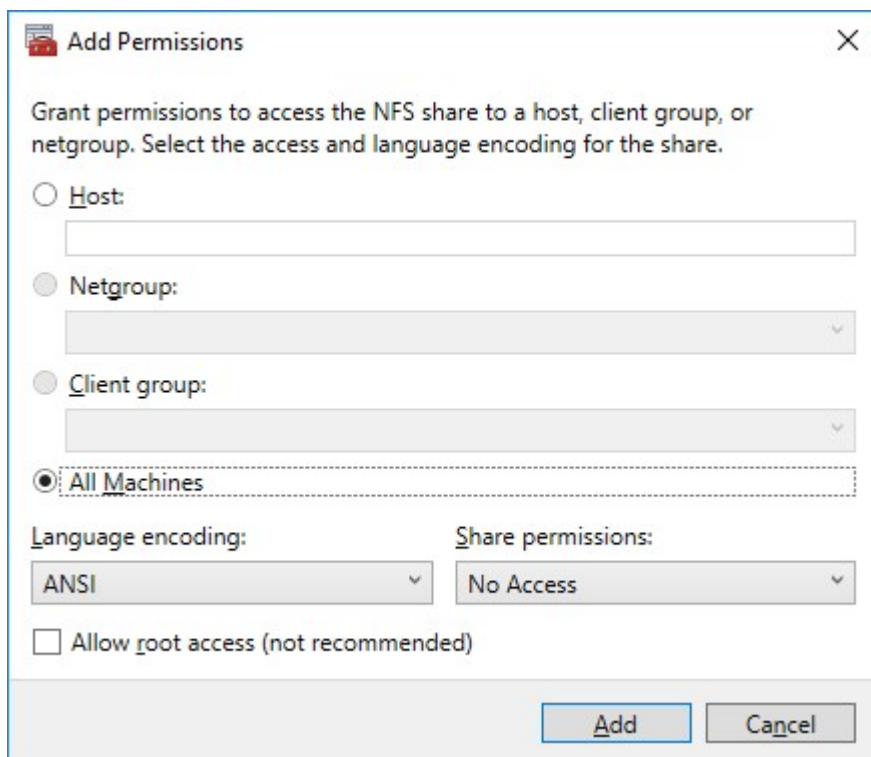

5. Select available storage to host the share. Click Next to continue.

continue.

8. Click Add and specify Share Permissions.

Add Permissions

Grant permissions to access the NFS share to a host, client group, or netgroup. Select the access and language encoding for the share.

☐ Host:

☐ Netgroup:

☐ Client group:

☒ All Machines

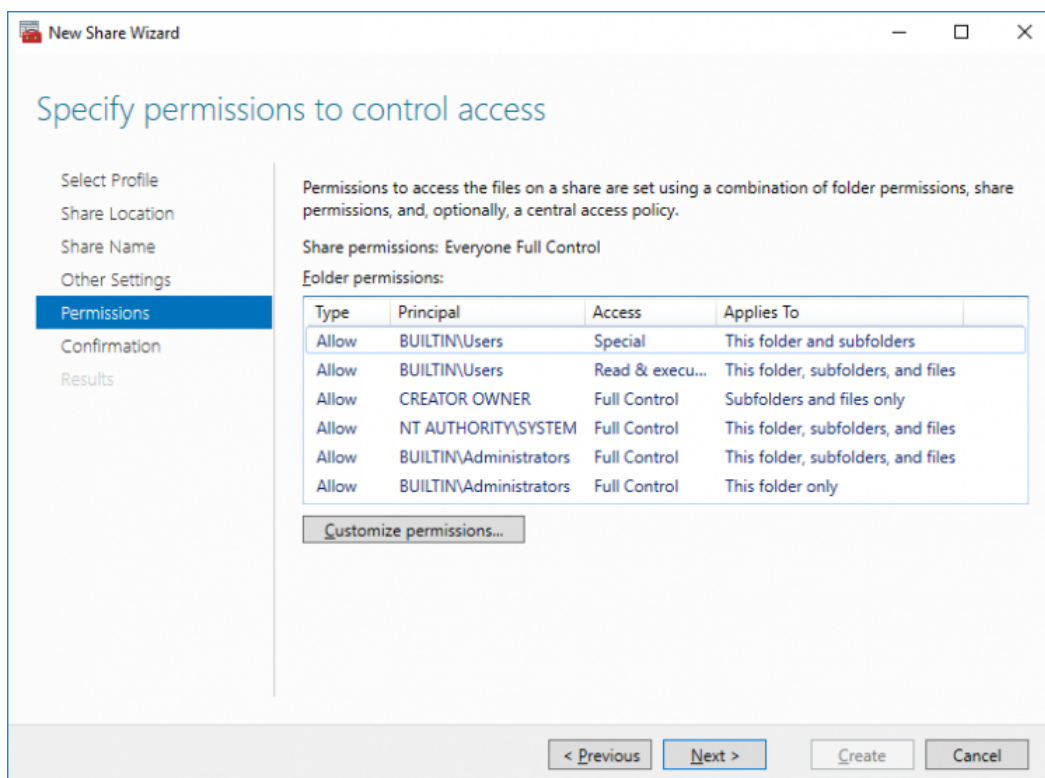

Language encoding: ANSI

Share permissions: No Access

☐ Allow root access (not recommended)

Add Cancel

9. Specify the access permissions for the file share.

Permissions to access the files on a share are set using a combination of folder permissions, share permissions, and, optionally, a central access policy.

Share permissions: Everyone Full Control

Folder permissions:

Type	Principal	Access	Applies To
Allow	BUILTIN\Users	Special	This folder and subfolders
Allow	BUILTIN\Users	Read & execu...	This folder, subfolders, and files
Allow	CREATOR OWNER	Full Control	Subfolders and files only
Allow	NT AUTHORITY\SYSTEM	Full Control	This folder, subfolders, and files
Allow	BUILTIN\Administrators	Full Control	This folder, subfolders, and files
Allow	BUILTIN\Administrators	Full Control	This folder only

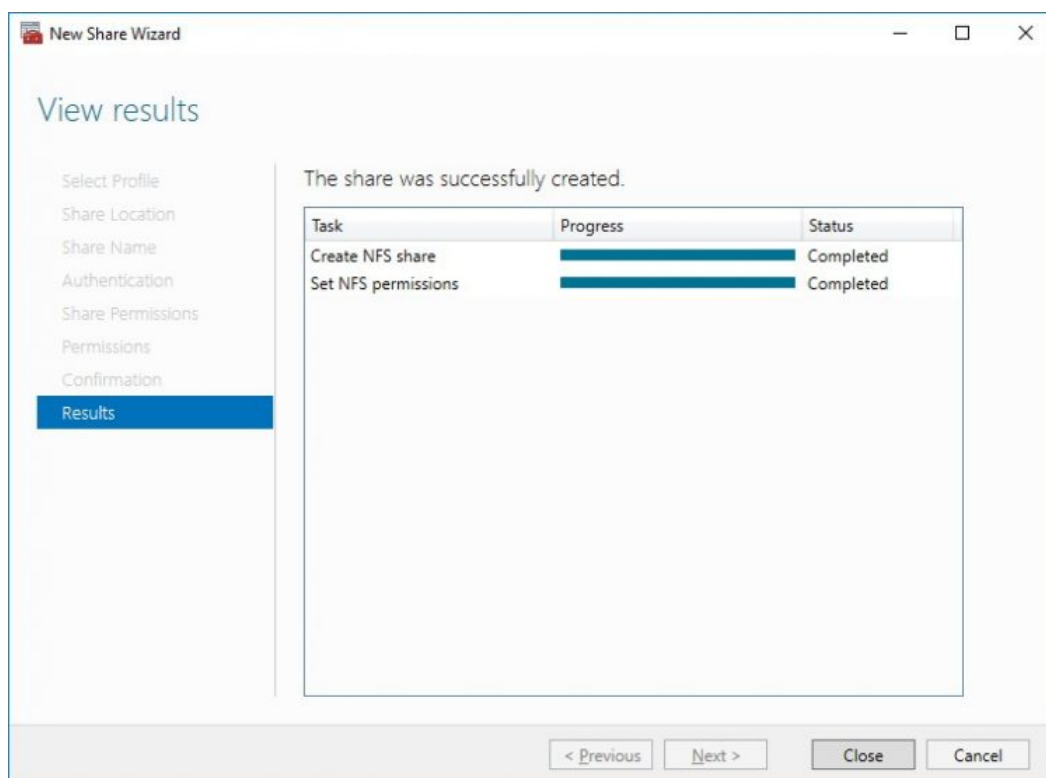

Customize permissions...

< Previous Next > Create Cancel

10. Check whether specified settings are correct. Click Previous to make any changes or click Create to continue.

11. Check a summary and click Close to close the Wizard.

To manage created NFS File Shares:

- open Failover Cluster Manager
- expand the cluster and click Roles
- choose the File Share role, select the Shares tab, right-click the created file share, and select Properties

Conclusion

Following this guide, IT professionals will get a successful cluster deployment on Microsoft Windows Server with a shared highly-available storage, provided by StarWind VSAN CVM.
